Prepared for:

Northern Colorado Plateau Network Inventory and Monitoring Program
National Park Service, U.S. Department of the Interior

Version 1.00 (December 15, 2004)

Note: This protocol is the Rocky Mountain Bird Observatory - Monitoring Colorado's Birds (RMBO-MCB) protocol written to National Park Service standards. This protocol is designed for long-term monitoring of breeding birds in sagebrush, pinyon-juniper, and riparian habitats using permanent survey transects. The selection of monitored sites in the Northern Colorado Plateau Network (NCPN) has not been performed, but is scheduled to be completed by February 2005, prior to the field season. Procedures for selecting upland sites are described. Procedures for selecting riparian areas for monitoring are suggested, but will require further exploration. This narrative describes the RMBO-MCB protocol in full. After all monitoring sites in the NCPN have been selected, this Protocol Narrative and the associated Standard Operating Procedures will be updated with the locations of monitored transects.

Revision History Log:

Important Note: This sampling protocol consists of this Protocol Narrative and the following Standard Operating Procedures (SOPs):

SOP 1:	Before the Field Season
SOP 2:	Training Observers
SOP 3:	Using Global Positioning System (GPS) Units
SOP 4:	Establishing and Marking Sampling Plots
SOP 5:	Conducting the Survey
SOP 6:	Documenting Habitat Variables
SOP 7:	Data Management
SOP 8:	After the Field Season
SOP 9:	Revising the Protocol Narrative and SOPs

Table of Contents

I. Background and Objectives

Issue being Addressed and Rationale for Monitoring Landbird Populations

Landbirds are a key component of the Northern Colorado Plateau Network (NCPN). Landbirds occupy various levels in the food web, and functionally, play an important role in the flow of energy through ecosystems. Landbirds consume insects as nestlings, rely on insects and plant components for food as adults, and serve as food resources for higher-trophic bird and mammal species. Landbirds also have high public appeal. Unlike many other animal taxa in the xeric NCPN, landbirds are mostly diurnal and thus, are more visible to park visitors. Public demand for bird-species information is common, ranging from requesting species' lists for tracking birds during park visits to status and trend inquiries to interpretive staff.

Landbirds have been shown to be useful indicators of ecosystem integrity (as defined by Karr and Dudley 1981). Bryce et al. (2002) successfully assessed riparian-habitat integrity in Oregon using a bird integrity index developed from abundance and species richness. In the Prairie Pothole Region of North Dakota, Browder et al. (2002) developed an index from the presence and abundance of breeding-bird species that consistently predicted grassland integrity. In a literature review of 109 studies conducted in the past 20 years, Bock and Jones (2004) found, with exceptions, a positive relationship between bird abundance and reproduction, confirming that bird counts are useful indicators of breeding habitat quality.

Continental and local declines in many bird species have lead to concern for the future of migratory and resident species. Breeding Bird Survey (BBS) data suggest that long-term, large-scale declines in bird populations have occurred over large portions of North America (Robbins et al. 1989). Some declines have been regional, while others have occurred in suites of species such as Neotropical Migratory Birds. Loss of wintering and breeding habitat, agro-chemical pollution, and various other factors have been postulated as reasons for declines in bird populations. The broad-scale inference of the BBS data, however, has been questioned by avian researchers. The difficulty associated with interpreting index counts (Sauer 2000), and other confounding factors (e.g., Robbins et al. 1986, James et al. 1996, Thomas 1996) have been highlighted as critical limitations of the BBS data. Also, since the BBS is a road-based survey, roadless areas and habitats not commonly adjacent to roads (e.g., riparian systems) are not surveyed (Norvell et al. 2003a). The BBS lacks an explicit habitat component, which limits the use of the data to understand responses to environmental change and management (Leukering et al. 2000). Given these short comings, regional habitat-based bird monitoring programs have been recommended to complement data generated by BBS (Leukering et al. 2000, and citations within; e.g., Sauer 2000, Sauer and Cooper 2000).

The Northern Colorado Plateau Network (NCPN) chose landbird communities as a vital sign because of the value of birds as indicators of ecosystem integrity, potential population declines, and high public appeal. Another key reason is the potential for NCPN to contribute to, and benefit from existing, regional breeding-bird monitoring

programs (e.g., Leukering et al. 2000, Norvell et al. 2003a). The NCPN will collaborate with one of these programs, the Rocky Mountain Bird Observatory's *Monitoring Colorado's Birds* (MCB), to monitor landbirds.

Central to this partnership is the use of similar survey methods throughout the intermountain west. The MCB program in NCPN park units will provide comparable information with the existing 900+ transects established in four other western states. Given land-use histories of national parks and other ownerships in the west, data from NCPN park lands will provide status and trend information for relatively 'natural' habitats. These data will afford useful comparisons with more impacted areas on other land ownerships. Comparable methods also will aid in discerning between local and global affects on breeding-bird populations. Global factors, such as the loss of migratory and wintering habitat or wide-spread pollution, will influence breeding populations similarly among land ownerships and locations. In such cases, trends in breeding-bird densities likely would be coincident across a large region. Conversely, local factors, such as breeding-habitat degradation, will manifest as site-specific or management-unit specific trends. The extent of the MCB program will allow comparisons between NCPN and extra-regional trends in breeding-bird populations, and aid in discerning between large-scale and local effects. Distinguishing between these effects is critical to recommending effective management actions. Lastly, the MCB program uses distance-based estimates of species' density in trend assessments. Detection functions employed in estimating density require a minimum number of observations. Sample-size needs often can not be achieved without pooling among surveys. Where necessary, data from similar habitats could be pooled among NCPN and other MCB surveys to derive credible detection functions for NCPN species.

Historical Development of Bird Monitoring in the NCPN

Birds have been monitored in the NCPN park units by a variety of projects (Appendix A). Raptor surveys are ongoing in several park units. Waterfowl and shorebird surveys have been conducted at Curecanti NRA. Park units participate or have participated in national monitoring programs, such as Monitoring Avian Productivity and Survivorship (MAPS), BBS, Breeding Bird Census (BBC), and Christmas Bird Count (CBC). Several park units conduct long-term (6+ years) point count or line-transect monitoring of land birds. Habitats primarily focused on by these long-term monitoring programs are riparian (Daw 2002) and pinyon-juniper. These monitoring efforts have attempted to follow state or national monitoring program protocols. However, most were not designed to achieve specific levels of change, and notably lack random site selection. Inference in these studies is generally limited to the sampled areas.

The Rocky Mountain Bird Observatory (RMBO) program known as *Monitoring Colorado's Birds* (MCB) was originally designed to provide population trend or status data on all regularly-occurring breeding species in the state of Colorado (Leukering et al. 2000). A recent goal of the MCB program is to expand to the level of Bird Conservation Regions (BCR) (Leukering et al. 2000). BCRs encompass distinct ecoregions. The North American Bird Conservation Initiative (NABCI) (NABCI Committee 2000) has selected BCRs as the focal unit for ranking conservation priorities among bird species.

The MCB program has already supplemented the approximate 400 sites in Colorado with about a total of 550 sites in South Dakota, New Mexico, and Wyoming. The collaborative effort between RMBO and NCPN will enhance the MCB program by including the ecosystems of Utah, and possibly northern Arizona (i.e., Pipe Springs National Monument). NCPN park units in the state of Colorado already are included in the MCB network. MCB is in its first phase, which involves collecting count-based data for all species that can be monitored effectively using a habitat-based approach. The second phase will involve demographic studies targeted at known declines to aid in management.

This NCPN Land Bird Monitoring Protocol is the RMBO-MCB Protocol written to NPS standards (as specified in Oakley et al. 2003), with one exception. A simple random selection of habitat patches has been used in the past by RMBO. This NCPN protocol uses a systematic sample of habitat patches (see SOP #4). This ensures that monitored patches are spatially distributed across the NCPN park units. All other procedures directly follow the MCB protocol. The RMBO-MCB protocol documents are included in Appendices B-D.

Three habitats are monitored in this protocol. These include sagebrush and pinyon-juniper, which dominate the NCPN landscape. The third is riparian habitat. Riparian areas are biodiversity 'hotspots' in dryland systems, and are highly vulnerable to adjacent land-use activities (e.g., water diversion) and to changes in climatic regimes. The selection of habitat patches and riparian areas to be monitored is scheduled to be completed by early 2005, prior to the field season. The number of park units included in this monitoring and exact location of transects are unknown at this time. Site-selection methods are described in this protocol without actual locations of survey sites. Sections related to the recommended time period for bird surveys also can not be completed until habitat patches are determined. Upon completing the selection of sites early in 2005, this Protocol Narrative and associated Standard Operating Procedures (SOPs) will be updated.

Measurable Objective
The objective of this protocol is to:

1. Determine the status and trends in breeding-bird species' density in sagebrush, pinyon-juniper, and riparian habitats.

The sampling objective of the MCB protocol is an 80% probability of detecting a 3% decline in species' density over a 30-yr period, with a Type I error rate of 10%. This objective applies to the MCB program in NCPN park units.

II. Sampling Design

Rationale for Selecting this Sampling Design Over Others

The RMBO-MCB protocol uses a combination of two distance sampling methods to survey breeding birds – transect and point-count sampling. Thirty randomly-located transects are used to sample a focal habitat, with transects randomly distributed among habitat patches. A total of 15 point-count stations spaced 250-m apart are located on each transect. Observers walk the transect, stopping at each point for 5-minutes, and record information for each detected bird. Species, sex, method of detection, and radial distance from the observer to the first detection of an individual are recorded. All birds detected from a station are recorded, regardless of the distance from the observer. The point-count stations in this protocol are effectively variable circular plots. While walking between stations on the transect, observations are recorded for low-density, rare, or unusual species. Distance and bearing are recorded for individuals detected on the line-transect instead of just radial distance. The time-dependent, distance-based sampling at point-count stations provides a standard sampling effort within and among habitats. The majority of trend information is derived using data from the point-count stations. The line transect component is designed to generate a larger sample size for low-density species. Although survey methods permit trend assessments for low-density species, line-transect component ensures that at least status information is collected for uncommon and rare species.

Including a distance measurement to the point and transect count methods permits derivation of a species-specific density estimate adjusted by a species' detectability (Ralph et al. 1995). A measure of relative abundance (e.g., no. observations/visits/area sampled) has been widely used in previous studies (e.g., Chambers et al. 1999, Hansen et al. 1995). Inherent in this measure is the assumption that the proportion of birds detected is the same among species and observers. Adjusting for detectability eliminates these assumptions, and overall, reduces a significant source of variation in trend data (Norvell et al. 2003b). In the MCB program, density is not intended as an end-product, but rather as an index of population trend that is not confounded by detectability issues. The Distance program is used to derive detection functions, and ultimately density estimates (Thomas et al. 1998). Each transect is treated as a sample; point-count stations are sub-samples.

Other bird-sampling methods employ area-based searches or point counts without consideration of detection probabilities. Programs such as MAPS, BBC, and BBIRD (Breeding Biology Research & Monitoring Database) involve intensive monitoring of fixed-sized plots (e.g., 20-ha), and collectively, involve marking individuals, mapping nests and territories, and recording fledging success through repeat visits. These approaches provide very detailed information about relatively small areas, and are relatively expensive. Also, the scope of inference of these methods is dependent on the network of similarly monitored plots. The CBC and BBS are point-count methods with inherent limitations due to the lack of an explicit habitat component, and the use of index counts rather than detectability-adjusted density estimates. The use of habitat-based, point-count distance sampling is a very cost-effective method to survey diurnal breeding-

bird populations when demographic information is not required. This protocol emphasizes diurnal breeding-bird species. Nocturnal species are not considered.

Site Selection

Details on site selection are provided in SOP #4. Sagebrush, pinyon-juniper, and riparian habitats will be monitored in NCPN park units using 30 transects per habitat type. Park units included in landbird monitoring will be determined by NCPN and RMBO. Once determined, sagebrush and pinyon-juniper habitat types will be identified on land-cover maps from the Southwest Regional Re-GAP Analysis Project (http://fws-nmcfwru.nmsu.edu/SWREGAP/factsheet.htm). For each park unit included in landbird monitoring, the upland sampling frame will be overlaid on the land-cover maps, and the UTM coordinates of grid points (i.e., centroid of a grid cell) included in sagebrush and pinyon-juniper habitats will be recorded. A sampling frame consists of a randomly oriented grid of points spaced 50-150 meters apart, and serves as the basis for selecting monitoring locations for a number of vital signs in the NCPN (see Chapter 4 of the NCPN Monitoring Plan for details). Accessibility is included in the sampling frame for park units. Inaccessible areas are those that are surrounded by steep slopes, such as deep canyon bottoms, that can not be reached without the use of air transport or mountaineering. Accessible areas are those that can be reached by hiking. The slope-adjusted distance from a road will be derived and stored for each accessible grid point on the landscape, and used to determine the selection probability employed in deriving a systematic sample. This protocol emphasizes monitoring and inference on a habitat level, not a park level. Thus, for each selected habitat type, patches will be combined across the park units selected for monitoring in deriving a systematic sample. Standard methods will be used to derive a probability-based systematic sample (e.g., Lohr 1999).

Riparian habitats with perennial streams will be identified on GIS stream-layer coverages which are currently being updated by the NCPN. The site-selection procedure used for upland habitats will be attempted. However, alternative methods may be required given the linear nature and length of riparian areas.

Once habitat patches and riparian corridors have been selected, MCB protocol procedures will be used to determine the location of each transect. Access points from roads and trails are determined during the initial visit. The start of a transect is determined by randomly determining a bearing from the access point if the habitat patch is adjacent, or by walking until reaching the patch if it is located away from the access point. Transect orientation follows the initial randomly selected bearing from the access point to the habitat patch. An exception is when monitoring linear habitats such as riparian areas. In such cases, a transect is located in the middle of the habitat and follows the orientation of the habitat. The 15 point-count stations are spaced 250-m apart, using the "way-points" feature on the GPS unit to ensure the correct straight-line distance. Point-count stations are not physically marked, so it is imperative that waypoints are accurate, and recorded in the GPS as well as on the RMBO-UTM Data Sheet (see SOP #4).

Population Being Monitored

Monitoring will be limited to the bird-breeding season (mid-May to mid-June), and will include those species that may potentially breed in the selected habitat types. The emphasis of this landbird protocol is to monitor breeding-bird species at a habitat level over the NCPN region, not at a park level. Sample sites for each of the three habitat types may be distributed over multiple NCPN park units, with only a minority of samples in any one park unit. Inference at the park level likely will not be appropriate. Thus, this protocol is designed to provide inference to the populations of breeding-bird species that occur in each of the three monitored habitat types within the collection of selected park units. As an extension of the RMBO-MCB program, target populations also include those in similar habitats within the MCB network.

Sampling Frequency and Replication

Three habitat types will be surveyed annually. The standard number of transects per habitat in the MCB protocol is 30. Each of three observers will survey 30 transects each year within a designated 3-week time period, completing up to two transects per field day. Sampling effort may be adjusted to accommodate the ability to derive credible detection functions for density estimation. Buckland et al. (1993) recommends 60-80 detections per species for adequate estimation of a detection function. This sample-size requirement can be met by polling data from NCPN units among years, or by polling data from other MCB surveys in similar habitats. Both the number of detections per habitat and the inter-annual variability will be examined after several years of data collection to determine necessary adjustments to sampling effort.

III. Field Methods

Field Season Preparations, Field Schedule, and Equipment Setup

The Rocky Mountain Bird Observatory is responsible for hiring, training, and supervising field technicians conducting this Land Bird Monitoring Protocol in NCPN park units. Observers must attend a 5-day training program conducted by RMBO in early May of each year. This training covers bird identification, distance estimation, and habitat-collection procedures. Additionally, a detailed explanation of the MCB protocol is provided (see SOP #2 for training topics). Even before this training program, it is important to become familiar with, or to review the bird species likely to be observed in the NCPN park units. Reference materials and guides for the NCPN area are documented in SOP #1. Equipment should be organized prior to the field season to ensure availability and that necessary repairs are made (see SOP #1). Observers working in NCPN park units will be provided with a recreational GPS unit for initially recording transect waypoints, and for subsequent navigating. Instructions for using recreational GPS units are provided in SOP #3. Before going into the field, waypoints of established transects must be uploaded into the GPS. Also, transect-location information should be transcribed

to the field-data sheets (see SOP #5). A portion of field-data sheets should be copied onto write-in-rain paper.

Surveys must be conducted within a three-week window after all migratory species have returned to an area. Scheduling transects for monitoring must be done prior to the field season. Each observer is responsible for monitoring 30 transects per year. An observer must survey two transects in a portion of the field days. Transects separated by the least amount of distance should be scheduled for completion within the same day.

Sampling Methods

Methods for locating transects are detailed in SOP #4. Survey locations are not physically marked, but must be relocated using previously recorded UTM coordinates. The use of a GPS to mark and to navigate to survey transects and point-count stations is thus critical, and is described in SOP #3.

General survey procedures are described in SOP #5. Surveys should only be conducted in weather conditions that allow for birds to be adequately heard and seen. Counts should be stopped if winds exceed 13-18 mph (raising dust, leaves, loose paper; small branches in motion) and if precipitation exceeds a drizzle. Surveys begin approximately one half hour before sunrise and end no later than 10:00 am.

Conducting the Survey

5-Minute Point Counts. Details of how to conduct point counts during the breeding season and for filling in the data form are given in SOP #5. Upon reaching a point-count station, habitat data are first collected following procedures described in SOP #6, and summarized below. Bird observations are then recorded during a five-minute period. All birds, regardless of the distance from the observer, are recorded. The species, method of detection, sex, and distance from station center to the individual are recorded. Species that usually occur in flocks are recorded as a cluster unit. The distance from the station center to the first detection of an individual is a key variable. Distance is used to derive a detection function that is subsequently used to derive density estimates with the program Distance (Thomas et al. 1998). Using a range finder, distances are to be measured to the nearest 1 meter. Rounding (e.g., to the nearest 5 or 10 meters) is to be avoided because this introduces bias in a detection function. A key assumption of distance-based sampling is that birds located at station center have a 100% probability of being detected. It is thus critical to record the distance from station center to birds that moved away from the center upon arriving at a point-count station. While at the station center, avoid movement, making loud noises, and other actions that would encourage nearby birds to move away without being detected. It also important not to attract birds to station center because this inflates the probability of detectability.

After the count is completed and the data sheet filled out, the GPS unit and written instructions are used to navigate to the next plot to sample.

Line Transect Component for Low-Density Target Species. The line transect component of the survey is conducted by continuously recording detections of low-density target bird species as the observer travels between point-count stations. In order to obtain an accurate density estimate, detections of low-density target species either at the point count station or while traveling between stations must have an associated radial distance and bearing from the observer to the bird. Specific guidelines are detailed in Appendix C and SOP #5 "Conducting the Survey". A list of low-density species for each habitat type is provided by RMBO prior to the field season. This list may change over time, depending on population trends.

Transects in Linear Habitat. Two adjustments are necessary to accommodate transects through linear habitats (e.g., riparian habitats). First, the start of the transect is strategically placed near the end of the habitat to make sure the entire length of the survey is accommodated. Second, the transect does not follow a prescribed bearing, but instead is located in the middle of the habitat and follows the orientation of the habitat.

Collecting Habitat Data

Habitat data are collected annually to aid in understanding potential reasons for trends in breeding-bird densities. These potential relationships may have practical applications in the management of habitat. The Rocky Mountain Bird Observatory currently collects two sets of habitat data based on protocols developed in 2000 and revised in 2004 (see SOP #6). For the 2000 protocol, habitat variables collected at each plot describe dominant and sub-dominant habitat type, seral stage, and canopy closure, as well as understory classification and percent cover. Data are collected at the landscape level (general habitat characteristics), and in a 50-m radius plot (understory characteristics) centered on each point-count station. In the 2004 protocol, measures are recorded within a 50-m radius plots for volume of individual plant species in sub-canopy and ground layers. Habitat data are collected at point-count stations before starting a bird count.

IV. Data Management

NCPN data-management procedures are detailed in SOP #7.

Database Overview

The Rocky Mountain Bird Observatory has designed and maintains a Microsoft Access database for entering and managing data collected during surveys. Data from field forms are entered into a local copy of the database by the person conducting the surveys. After a series of quality control checks, these database records are then uploaded into the central MCB database located at the RMBO offices in Ft. Collins. In December, 2004, the database was undergoing an upgrade and redesign in order to improve functions and normalization. RMBO also is designing an Internet-based application of the database so that data entry can be completed on-line. Both developments are expected to be completed in 2005.

At the conclusion of a field season, after data have been entered, verified, and validated by RMBO, a subset of the database in Access format will be provided to NCPN. This subset will comprise all records entered to date for survey locations within NCPN park units.

Metadata Procedures

Documentation of all database tables and fields will be maintained by RMBO. The NCPN will complete and maintain an I&M Dataset Catalog record for the project and the database, and will update the record contents annually. Any spatial datasets created by the NCPN that are used for data analysis or distribution will have associated FGDC-compliant metadata records completed using ArcCatalog.

Data Archiving Procedures

Archived versions of the database will be created and stored by RMBO. Original field forms will be stored at the RMBO office in Ft. Collins, with a set of copies stored off-site at a different RMBO office.

The annual database files received by the NCPN will be archived on the NCPN server in their native Access format. This will be supplemented by a platform-independent copy of the database tables in ASCII format, which NCPN staff will create using the Access_to_ASCII utility developed by NCPN. All archived files are designated as read-only.

V. Summary of Rocky Mountain Bird Observatory Analysis and Reporting

Analysis of data collected in NCPN Park units, as well as reporting of final results, is the responsibility of RMBO. Population trends will be analyzed using density estimates as an index that is not confounded by detectability issues. Status and trend information will be analyzed at multiple levels for comparisons. Levels include ecoregion, management unit (NCPN park units vs. others), and habitat. The RMBO will produce annual summaries of observations, as well as periodic trend analyses, and send copies to the NCPN Inventory and Monitoring Project Manager. These reports and publications also will be available on the World Wide Web.

VI. Personnel Requirements and Training

Roles and Responsibilities

The NCPN Ecologist will be responsible for coordinating the implementation of this monitoring protocol with the RMBO. The Ecologist is specifically responsible for obtaining copies of all data collected in NCPN Park units by RMBO. The Data Manager is responsible for data archiving, data security, dissemination, and metadata procedures.

Qualifications and Training

Observer bias can have a strong influence on trend analysis of songbird populations (Peitz et al. 2002, Scott et al. 1986, Sauer et al. 1994, Kendall et al. 1996). Thus, the most essential component for the collection of credible, high-quality data on birds is a competent observer. The Rocky Mountain Bird Observatory is responsible for ensuring the competency of field technicians conducting the monitoring protocol.

VII. Operational Requirements

Annual Workload and Field Schedule

Monitoring will occur within a 3-week time frame (e.g., between mid May to mid June) that corresponds to when all migratory species have returned to an area. The exact time frame for each habitat type or transect will be determined by NCPN and RMBO after site selection is completed. In early May, RMBO requires observers to attend a 5-day training workshop that covers the MCB protocol procedures.

Three observers will monitor 90 transects in the NCPN park units. Each observer will be responsible for completing 30 transects per year. Up to two 15-point transects are to be completed in one field day.

Facility and Equipment Needs

Facility needs include normal office space at RMBO to administer the program, and use of the data management work station at the NCPN Inventory and Monitoring headquarters for metadata and archival purposes. SOP #1 "Before the Field Season" lists equipment needs for one observer.

Startup Costs and Budget

A pending agreement between NCPN and RMBO includes a funding level of $30,000 per year for landbird monitoring. At this funding level, RMBO will be responsible for: 1) the establishment and monitoring of 90 transects in selected habitats in NCPN park units; 2) hiring and training observers; 3) dispersing payment of salary and per diem to observers; 4) providing all necessary equipment with the exception of NCPN-provided GPS units; 5) performing data entry, management, and analysis; and 6) generating the annual status and trend reports.

Procedure for Revising the Protocol and Archiving Previous Versions of the Protocol

Revisions to the Protocol Narrative and SOPs will be inevitable over time. Explicit documentation of these changes is critical for proper interpretation and analysis of bird-survey data. Procedures for changing the protocol narrative and related SOPs are

documented in SOP #9. The Protocol Narrative and all SOPs are labeled with version numbers, and include a Revision History Log. Changes to either document type are to be accompanied by changes in version numbers; version numbers and dates, the changes, reasons for the changes, and the author of the changes are to be recorded in the Revision History Log. The updated version numbers must be recorded in the Land Bird MasterVersion Table (MVT) (see SOP #9) and conveyed to the Data Manger for proper updating of the master version table database. Previous versions of the Protocol Narrative and SOPs must be archived in the NCPN Land Bird Protocol Library (X:\Archive\Monitoring_Archive\Landbird\Protocol_Library\).

Appendix A - Avian Monitoring in NCPN Park Units

Information is current as of 12 December, 2002. Years of monitoring are shown where known; an "X" indicates intermittent monitoring or monitoring of unknown duration; Historic indicates monitoring that was discontinued by 2002.

	National Programs				Local Programs		
	Monitoring Avian Productivity and Survivorship (MAPS) – mist-netting	Breeding Bird Census (BBC) – territory/spot mapping	Breeding Bird Survey (BBS) – point counts	Christmas Bird Count (CBC) – area search	General Raptor Surveys	General Point Counts or Line Transects	Species Specific
Arches NP		19 yrs in pinyon-juniper	13 yrs	X	X	10 yrs - riparian	great blue heron
Black Canyon of the Gunnison NP					X	6 yrs	Gunnison sage grouse, peregrine falcon
Bryce Canyon NP			Historic	Historic		Historic	SW willow flycatcher, Northern goshawk, peregrine falcon
Canyonlands NP		11 yrs – pinyon-juniper	11 yrs		X	10 yrs - riparian	Mexican spotted owl, SW willow flycatcher, peregrine falcon
Capitol Reef NP	7 yrs - riparian		12 yrs		X	10 yrs – riparian by UT Dept. Wildl. Res.	Mexican spotted owl, peregrine falcon
Cedar Breaks NM					X		peregrine falcon
Colorado NM (COLM)				X (1946-02) - data distinguished for COLM since 1992	1990-02 – mainly peregrine falcon		Gray, plumbeous vireos, peregrine falcon
Curecanti NRA					X	10 yrs	Gunnison sage grouse, great blue heron, peregrine falcon, migratory waterfowl, shorebirds
Dinosaur NM				X		ca. 20 yrs – fire-effects monitoring	Canada goose, peregrine falcon
Fossil Butte NM							sage grouse
Golden Spike NHS						Historic	
Natural Bridges NM					X	10 yrs - riparian	peregrine falcon
Pipe Springs NM				X			
Zion NP				X	X	4 yrs	Mexican spotted owl, peregrine falcon, Northern goshawk, bald eagle, SW willow flycatcher

Appendix D - Changes to the RMBO Monitoring Program Vegetation and Bird Count Protocols 2004 – Rocky Mountain Bird Observatory

Weather data

Please see clipboard sheet for explanations of the various weather data requested: sky code, wind speed, and temperature.

Atlas page and location

Enter the page number on which the Access Point of the current transect is located – putting this value in the correct set of boxes (either the De Lorme atlas or the "Roads of" atlas). Then enter the horizontal and vertical grid reference of the Access Point of the current transect. ALWAYS list the letter first, regardless of whether letters make up the X axis or the Y axis of the maps. You may use "half-grids" to indicate points approximately halfway between either two numbers OR two letters, e.g., A.5-2 or C-3.5; use a hyphen to separate the two components of the value. If you are using only whole grid references, e.g., B1 or D7, then do NOT use a hyphen to separate the components.

GPS info

Unit # - Write the last four digits of the GPS unit number (from the silver sticker affixed to the unit) in the appropriate space.

Point # - Enter the saved waypoint number referable to the point at which you are standing (from the GPS unit) in the appropriate space.

Point info

<100m to road? - Enter 'Y' here if the point at which you are standing is within 100 meters of a road; otherwise, enter 'N'.

Private property? - (Not for Wyoming program) Enter 'Y' if the point at which you are standing is on private property; otherwise, enter 'N'.

Distance to edge - (For Wyoming program ONLY) Enter estimate or measured distance to nearest habitat edge.

Bearing to point – Enter the bearing (either from the Access Point or from the previous point) that you took to get TO the point at which you are standing.

Overstory

Seral (i.e., structural) stage - At each point-count station, identify and record the *average* structural stage of the overstory trees within a 50-m radius of the point-count station. Please use the following scale:

1	grass-forb (i.e., no or very few overstory trees present)
2	shrub-seedling (i.e., generally trees below head height)
3	sapling-pole
4	mature
5	old-growth

Canopy Closure - Estimate the percent closure of the canopy trees within a 50-m radius of the point-count station and select the best choice from the following categories:

A	<40%
B	40-70%
C	>70%

Height - At each point-count station, estimate the average height of the canopy trees (in meters) within a 50-m radius circle to the nearest meter. Use a range finder to help gauge estimates.

Species Composition - Identify the dominant tree species in the overstory and record the *relative* percent of the total overstory occupied by each species within a 50-m radius of each point-count station; as many as five species may be listed. Note that if only one tree species is present in the overstory, the relative percent should be 100% (9), regardless of how much of the circle is occupied by the tree species. Tree species should be recorded on the data forms using the correct 2-letter vegetation code provided in the list. Please use the following scale for recording relative abundance of each overstory tree species:

0	01-09%
1	10-19%
2	20-29%
3	30-39%
4	40-49%
5	50-59%
6	60-61%
7	70-71%
8	80-81%
9	90-100%

Additional Habitats

In some cases, additional distinct habitats may be present within the 50-m radius circle around the point-count station that do not get adequately characterized in any of the assessments of specific habitat components (e.g. overstory, shrub layer). For example, a meadow or riparian area may occur within the circle, along with the dominant forest or other habitat, but may contribute little to either the shrub layer, mid story or overstory. Nonetheless, these minor habitats may by significant for the birds present within the 50-m circle. In these situations, list up to three additional habitats in the appropriate space, using the 2-letter habitat codes provided.

Sub-canopy/mid-story

In forest, this category is intended to assess the foliage mass roughly in the middle vertical third, particularly if there is a distinct sub-canopy of a different species mix than that present in the overstory.

Volume – Estimate the foliage mass in the middle vertical third of the forest in 20% increments: 1 = 1-20%, 2 = 21-40%; 3 = 41-60%; 4 = 61-80%; and 5 = 81-100%. Note that it would be quite rare for this category to score greater than 3 and that many (most?) probably score less than 3.

Species – If, and only if, there is a distinct sub-canopy comprised of tree species different from that making up the overstory, enter as many as three species' 2-letter codes in the spaces provided. If there is no distinct sub-canopy, enter "N" in the Species #1 space.

Shrub Layer

This category is intended to estimate the amount and species makeup of any woody shrub (*including* seedling trees) layer present. Generally, shrubs are >0.5 meter high and <5.0 meters high. Anything taller than 5.0 meters should be considered part of the sub-canopy (e.g., very tall oaks or aspens that are of greater height); anything shorter than 0.5 meter should be considered in the ground cover category.

Volume – Estimate the foliage mass of all woody shrub species AND seedling trees present (see definition above) scored on a 10-point scale, for which, see **Overstory** Species compostion.

Mean height – Estimate the average height (to the nearest meter) of the shrub layer within a 50-m radius of the count station.

Species composition - Identify the shrub species (including seedling trees) present and record the *relative* percent of the total shrub layer occupied by each species within a 50-m radius of each point-count station; as many as five species may be listed. Note that if only one shrub species is present, the relative percent should be 100% (9), regardless of how much of the circle is occupied by the species. Shrub species should be recorded on the data forms using the correct 2-letter vegetation code provided in the list. Please use the same 10-point scale as above, for recording relative abundance of each species.

Ground Cover

Ground cover is classified into four categories:

   1) woody vegetation below 0.5 m (roughly knee height),
   2) broad-leaved herbaceous plants (forbs),

    3) grass, and
    4) bare ground and/or leaf litter.

At each point-count station, estimate (to the nearest 10 percent) the total percent of ground cover within the 50-m radius circle around the point-count station that qualifies for each category. Please use the same 10-point scale as presented above, but note that for ground cover, this is an absolute scale, rather than a relative scale.

At each point count that is conducted, please put an "N" in the box for any category that is absent from the 50-m circle, rather than leaving it blank. It will be assumed that blank boxes represent point counts where the ground cover was not assessed, either because the count was not conducted or because you forgot to record it.

Land Bird Monitoring Protocol for the Park Units in the Northern Colorado Plateau Network

Standard Operating Procedure (SOP) # 1

Before the Field Season

Version 1.00 (December 15, 2004)

Revision History Log:

Prev. Version #	Revision Date	Author	Changes Made	Reason for Change	New Version #

This Standard Operating Procedure (SOP) describes pre-season procedures for monitoring landbirds in the Northern Colorado Plateau Network (NCPN). Landbird monitoring in the NCPN is conducted by Rocky Mountain Bird Observatory (RMBO), and is part of the Monitoring Colorado's Birds program. Before conducting surveys, observers should review the entire NCPN protocol narrative, including SOPs, as well as the detailed RMBO protocol and supplements (see Appendices B-D in the NCPN Land Bird Monitoring Protocol Narrative). This SOP describes general pre-season preparation, scheduling considerations, and supplies and equipment needs.

I. General Preparation and Review

Procedures:

1. Prior knowledge of species likely to be encountered in the NCPN park units selected for monitoring will be key in preparing for the birding season. Observers should review the list of bird species by NCPN park unit in Attachment A. Copies of species lists can be used in the field for reference.

2. Waypoints for each point-count station on a transect or for a riparian transect must be loaded into the GPS unit prior to the start of the field season. Waypoints are the X and Y coordinates for each point-count station, and are used to navigate to their location. SOP #4 contains a list of point locations for all transects in NCPN park units with their associated UTM coordinates. Way points for transects also will be stored as part of the project metadata (see SOP #7).

3. The following reference manuals should be reviewed for background information on conducting bird surveys and habitat measures:

- Elmore, F.H. 1976. Shrubs and Trees of the Southwest Uplands. Southwest Parks and Monuments Association. Globe, Arizona.
- National Geographic. 1987. Field Guide to Birds of North America, 3rd Edition. National Geographic, Washington, D.C. 480 pages.
- Robbins, C.S., B. Bruun, and H.S. Zim. 1983. Golden: A Guide to Field Identification of North American Birds. Western Publishing Company, Inc., Racine, WI. 360 pages.
- Stokes, D. W. and L. Q. Stokes. 1995. Stokes Field Guide to Birds: Western Region. Little, Brown and Company, New York, NY. 519 pages.
- Welsh, S.L., N.D. Atwood, S. Goodwich, L.C. Higgins. 1993. A Utah Flora. Brigham Young University, Second Edition, Provo, Utah. 986 pp.
- Williams, D. 2000. A Naturalist's Guide to Canyon Country. A Falcon Guide. The Globe Pequot Press. Guilford, Connecticut.

4. All observers must attend the five-day training workshop conducted by The Rocky Mountain Bird Observatory in early May each year (see SOP #2).

II. Scheduling Field Work

Procedures:

1. Breeding bird surveys will be conducted during the period that coincides with the peak-breeding activity of most birds (May, June, and into July for higher elevation habitats). Specific survey dates may vary slightly because of weather, but will be within a 3-week period established for each transect. The sampling window will be determined by RMBO, and documented herein. Sampling dates should be scheduled, and logistics organized prior to the start of each field season.

2. Three observers are required to sample 30 transects in each of three habitat types each year. Each observer is to complete up to two 15-point transects each field day. This includes collecting habitat data at each point (where applicable) before beginning the bird count. To ensure completion of surveys, it is imperative to schedule survey times prior to the field season. When two transects must be completed on the same day, transects separated by the least amount of distance should be selected.

III. Organizing Supplies and Equipment

Procedures:

1. Equipment (Table 1-1) should be organized and made ready several weeks before the field season.

Table 1-1. Field equipment list, based on the *Monitoring Colorado's Birds* program (see Appendix C of the NCPN Land Bird Monitoring Protocol Narrative).

Number Req.	Description
	Bird surveys
1	Timepiece with countdown timer and a chime
1	Binocular
1	Rangefinder and extra batteries
1	Declination-adjustable compass with sighting capability (i.e. a mirror)
1	Fahrenheit thermometer
1	GPS unit for navigating to bird plots
1	Master list of four-letter bird codes for all species likely to be encountered, specifically noting the low-density target species
1	Master list of weather and habitat codes, taped to the clipboard
1	Random numbers table, if establishing a new transect
as needed	Data forms (copied onto write-in-rain paper)
2 - 3	At least two writing utensils – in case you lose one (pencil or indelible ink pen)
1	Clip boards for recording data and carrying data sheet
1	Cruising vest for carrying equipment (backpack and hip packs may be substituted)
as needed	Reference books for bird and plant identification
1	Insect repellent
1	Sunscreen
1	First Aid kit

Attachment A

Bird Species determined to be migrants and breeders in NCPN park units. Information source is the current version (2.2) of the NPSpecies XP Inventory and Monitoring Database. Species lists were developed using data that has not been through the QA/QC process of Certification. Park unit acronyms are defined in Attachment B.

Land Bird Monitoring Protocol for the Northern Colorado Plateau Network National Parks and Monuments

Standard Operating Procedure (SOP) # 2

Training Observers

Version 1.00 (December 15, 2004)

Revision History Log:

Prev. Version #	Revision Date	Author	Changes Made	Reason for Change	New Version #

This Standard Operating Procedure (SOP) summarizes the training workshop conducted by the Rocky Mountain Bird Observatory for all participants in their *Monitoring Colorado's Birds* program. Observers surveying Northern Colorado Plateau Network (NCPN) park units must participate in the RMBO training. Additionally, supplemental information of value to observers working in the NCPN park units is provided.

Procedures:

1. In early May of each year, the Rocky Mountain Bird Observatory conducts a five-day training workshop for all observers participating in their *Monitoring Colorado's Birds* program. Training includes the following topics:

    - Identification of birds by sight and vocalizations
    - Estimating distances to birds seen or heard
    - Collecting habitat data
    - Using a GPS unit
    - Detailed explanation of the protocol

2. Supplemental reference manuals for bird surveys and habitat-collection procedures are listed below, and should be reviewed by observers working in NCPN park units:

    - Elmore, F.H. 1976. Shrubs and Trees of the Southwest Uplands. Southwest Parks and Monuments Association. Globe, Arizona.
    - National Geographic. 1987. Field Guide to Birds of North America, 3rd Edition. National Geographic, Washington, D.C. 480 pages.

- Robbins, C.S., B. Bruun, and H.S. Zim. 1983. Golden: A Guide to Field Identification of North American Birds. Western Publishing Company, Inc., Racine, WI. 360 pages.
- Stokes, D. W. and L. Q. Stokes. 1995. Stokes Field Guide to Birds: Western Region. Little, Brown and Company, New York, NY. 519 pages.
- Welsh, S.L., N.D. Atwood, S. Goodwich, L.C. Higgins. 1993. A Utah Flora. Brigham Young University, Second Edition, Provo, Utah. 986 pp.
- Williams, D. 2000. A Naturalist's Guide to Canyon Country. A Falcon Guide. The Globe Pequot Press. Guilford, Connecticut.

3. The NCPN may provide a recreational GPS unit to observers working in park units. Instructions on using a recreational GPS unit are provided in SOP #3.

Land Bird Monitoring Protocol for the Park Units in the Northern Colorado Plateau Network

Standard Operating Procedure (SOP) # 3

Using Global Positioning System (GPS) Units

Version 1.00 (December 15, 2004)

Revision History Log:

Prev. Version #	Revision Date	Author	Changes Made	Reason for Change	New Version #

This Standard Operating Procedure (SOP) explains the procedures and considerations that all observers should follow when collecting geospatial data or navigating to locations. This SOP is written for use with recreational-grade GPS units such as those manufactured by Garmin or Magellan. These units are far less expensive than mapping-grade units (e.g., Trimble GeoExplorer), yet they are effective for obtaining point information at a level of spatial accuracy that is required for this project. Recreational-grade GPS units do not have the capability of a data dictionary for storing attribute information with point locations.

This SOP assumes that each observer is familiar with the operation and function of the GPS unit to be used for this project. This SOP is intended to complement, not replace, the operations manual accompanying the GPS unit. Each observer should be familiar with the use of their particular GPS unit before entering the field to collect data or navigate to points.

This SOP does not require the use of a specific type or brand of GPS unit; however, the unit is required to meet the minimum standards listed below. The Northern Colorado Plateau Network (NCPN) has used primarily Garmin units, specifically, the eTrex, III Plus, and 76 models. Detailed instructions relating to the Garmin 76 model and this protocol are included in Attachment A. Functions other than those associated with this protocol are not explained in this document.

Procedures:

1. The minimum GPS receiver standards for navigating and mapping are:

- Capable of storing date, time, and coordinates of features collected.

- Capable of exporting features collected to a format that can be used by a GIS
- Capable of maintaining an EHE (Estimate of Horizontal Error) of less than or equal to 12 meters. Maintaining an EHE (or EPE – Estimate of Positional Error) of 12 meters or less meets the National Map Accuracy Standard.
- Capable of tracking a minimum of 4 satellites
- Capable of collecting real-time differentially-corrected positions (DGPS)

2. Required equipment

- GPS unit
- One set of extra batteries
- Operation manual
- Compass
- Rangefinder
- USGS 1:24,000-scale topographic map
- Personal computer for downloading data from the GPS unit. DNR Garmin (freeware, available at http://www.dnr.state.mn.us/mis/gis/tools/arcview/extensions.html) should be installed on the computer to facilitate the data download.

3. GPS Unit Setup before leaving the office (see Attachment A)

- set GPS unit standards

Minimum GPS Receiver Settings Standards

Name	Standard
Projection (displayed coordinates)	UTM
Datum	NAD 27 CONUS
WAAS	Enabled (on)

- upload background data (MapSource)
- upload existing waypoints to the GPS unit (if necessary)

4. Navigation to an existing location

When the observer needs to revisit the points that make up the transects, the observer can relocate those points using the GPS unit. Navigation to the point is best accomplished by using background maps that have been loaded onto the GPS unit, in addition to using hard-copy USGS 1:24,000-scale topographic maps.

- Select the waypoint you wish to navigate towards and follow the pointer displayed on the unit.
- In order to navigate, the GPS unit must be moving

5. Collecting new location data

Once the observer has navigated to the beginning of a transect, a series of 15 waypoints will be taken to represent each transect.

- Take (or mark) a waypoint, and identify it with a unique ID that matches the location identifier recorded on the field sheet: Transect number (2 letter habitat code and 2 digit transect number) and 2 digit point number. Ex. MS0112 Montane Shrub, 01 Transect, Point # 12. Space permitting, the NCPN recommends adding a GPS unit ID letter to the end of the waypoint ID (MS0112C would indicate GPS unit "C" was used).
- Record waypoint UTM coordinates that are displayed on the GPS unit on field sheet

Collection of Access Points can be accomplished in the same manner. A suggested waypoint ID for access points is the letter "A", a 2 digit number, and 2 letter habitat code. Ex. A01MS would indicate this point is Access Point #1 for a Montane Shrub transect. These access waypoint IDs should be included in the notes under "Directions to Access Point" on the UTM Data Sheet.

6. Downloading Data from GPS unit (see Attachment A)

The data from the GPS unit are downloaded to a personal computer daily, or after each field stint. Frequent, regular downloads will safeguard against any loss of data.

NCPN recommends the use of the DNR Garmin extension. This tool facilitates the communication between ArcView and Garmin Brand GPS units by allowing users to download and upload waypoints (and tracks) as text files, shapefiles and/or graphics. DNR Garmin is freeware, and is available at
http://www.dnr.state.mn.us/mis/gis/tools/arcview/extensions.html)

- Connect the GPS unit to the personal computer using a USB or serial cable.
- Download GPS data (.txt files) into appropriate folders (Figure 3-1). Fields required from a unit download are: ident (waypoint), lat, long, y_proj, x_proj, comment, altitude, and model.
- Review the downloaded data for accuracy and completeness.

Text files are required as part of the download. GIS shapefiles can be created at the same time. See Attachment A for additional information on shapefile creation. NCPN recommends that during the field season downloads be limited to text files, with a single set of GIS shapefiles created at the conclusion of the field season.

Downloaded GPS text files will be appended to the Land Bird database at the time of data entry (see SOP # 7). At this time, all GIS data will be converted to the NPS standard projection of UTM NAD83. Both NAD27 and NAD83 coordinates will be preserved in the database. Spatial files will be maintained in NAD83.
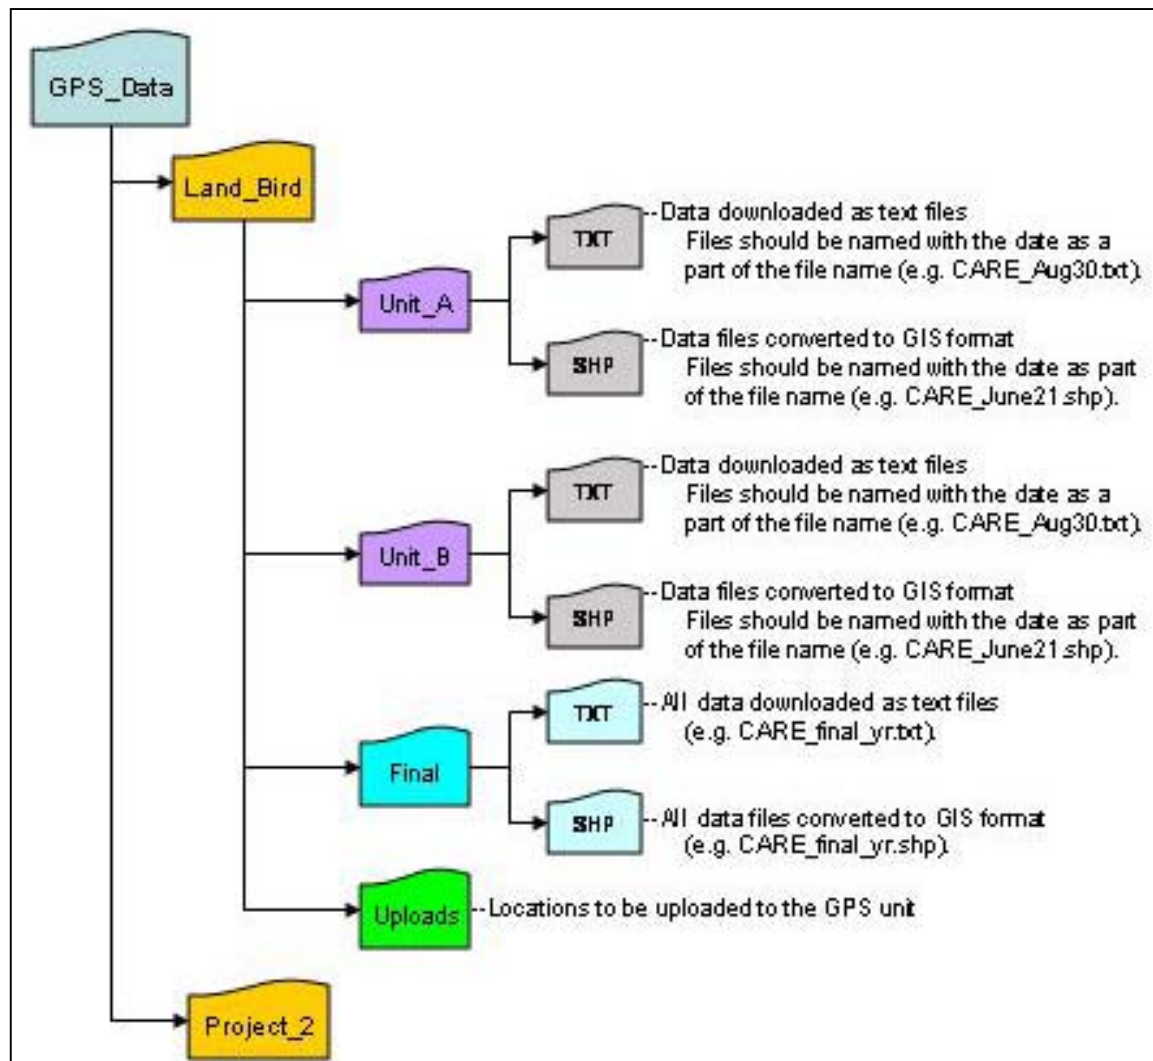

Figure 3-1. Recommended directory structure for data downloaded from GPS unit.

Attachment A
This graphic demonstrates the keys of a Garmin 76 GPS unit, and their functions. These keys are referred to in the following instructions.

1. To Connect GPS to Computer

- Either a serial or USB port cable will accompany the GPS unit. This is the cable that connects the GPS receiver to your workstation computer, allowing the uploading and downloading of waypoints.
- The serial or USB end of the cable attaches to your workstation computer. The other cable end (below) inserts into the Garmin GPS unit (lift bottom of black flap on the back of the GPS unit)
2. To change the displayed map projection:
- Turn on the unit by depressing the POWER key
- Set Projection
    1. Access the Main Menu (press the MENU key twice)
    2. Using the rocker key, scroll down to Setup and press the ENTER key
    3. There are several tabs listed (General, Time, Units, Location, Alarms & Interface) – using the rocker key, scroll over to the Location tab. Scroll down with the rocker key to Location Format and press the ENTER key.
    4. Scroll down the list of formats to UTM UPS, make sure this choice is highlighted, and press the ENTER key.
    5. Scroll down to Map Datum, press the ENTER key. Scroll down through the Map Datum choices, press the ENTER key when NAD 27 CONUS is highlighted.
    6. Press the PAGE key to get back to the "GPS Information" screen. (If the GPS Information screen is not showing, press the PAGE key; it will cycle through the screens). The bottom of the screen should now be displaying coordinates as UTM.

3. Set GPS to log differentially correct data
- If not already on, power up the GPS
- Enable WAAS
    1. Access the Main Menu (press the MENU key twice)
    2. Using the key, scroll down to Setup and press the ENTER key
    3. There are several tabs listed (General, Time, Units, Location, Alarms & Interface) – using the rocker key, scroll over to the Location tab. Scroll down with the rocker key to General and press the ENTER key.
    4. Scroll down to WAAS, press ENTER, highlight Enabled, and press ENTER
    5. Press the PAGE key to exit Setup

4. In the Field
- Collect (or mark) a waypoint
    1. When at the observation location, check the GPS Information page for number of satellites (4 or more needed) and accuracy (12 meters or less)
    2. Press and hold the ENTER/MARK key until the Mark Waypoint Page is displayed.
    3. Using the Rocker key, change the waypoint ID to Transect, point #, optional GPS letter
    4. Using the Rocker key, highlight "OK" and press ENTER
- Navigation
    1. Press the NAV key
    2. Select 'Go To Point' then press the ENTER key
    3. Select 'Waypoints' then press the ENTER key
    4. Select 'your point' then press the ENTER key

5. Highlight the 'GoTo' button, press ENTER
6. As you start walking, the Pointer will point to your destination

5. Upload Background Data

- Upload background maps from MapSource (proprietary software) if needed
- Upload waypoints using DNR Garmin
    1. Connect GPS to the computer
    2. Turn GPS on, then open DNR Garmin, it will connect to the computer
    3. When the MN DNR – Garmin window opens, make sure that the projection is set to NAD27, UTM, zone 12N (unless at CURE or BLCA, which are zone 13N). Go to File, then Set Projection to
change projection.
    4. Click on File, then Load From. You can upload a .txt file, .dbf file or a shapefile. Navigate to the file you wish to upload and click Open.
    5. A window will open prompting you select description information. Choose appropriate fields for Ident (ID) and Comment and click OK.
    6. A window will open stating "File was loaded successfully from….", click OK

7. Points will be displayed in the MN DNR – Garmin window.
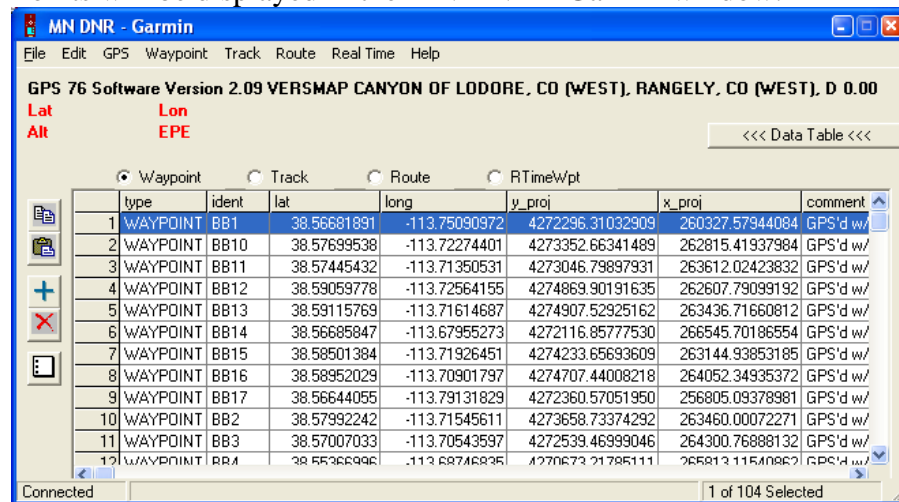

8. If the points are correct, click on WAYPOINT, then Upload
9. A window will pop up stating "Transfer Complete. # points uploaded"

6. Downloading Waypoints
- Download waypoints using MN DNR Garmin freeware
    1. Connect the GPS to the computer and turn on the GPS unit, then open the program DNR Garmin on the computer
    2. From the DNR Garmin main menu, click on Waypoint, then Download. Your data will appear in the MN DNR Garmin window (see below). Elements to be included in the downloading process are: type, ident, lat, long, y_proj, x_proj, comment, altitude & model. These fields can be chosen by choosing Waypoint from the main menu, then Waypoint Properties and checking only those fields.
    3. Click on File, then Save To. Navigate to the proper folder on the computer (see possible directory structure, Figure 3-1)
       There are several file types which you can save the file as. The NCPN recommends saving the data as a Text File (Comma delimited)(*.txt) file. This is the default choice.

4. Name the file with the date of download in the file name (example: Peregrine_June10_05.txt) and click the Save button. A window will display "File successfully written to …"

- Download waypoints using MN DNR Garmin and ArcView 3.x
  1. Connect GPS unit to workstation
  2. Open and activate the DNR Garmin-ArcView extension in ArcView. A DNR Garmin dropdown menu will be added to ArcView.
  3. From the DNR Garmin menu, choose "Set Projection". Choose UTM NAD27, and the appropriate zone (12 for all NCPN parks except CURE and BLCA which are 13)
  4. From the DNR Garmin menu, choose "Open Garmin GPS". The following window opens:
  5. From this window, click on Waypoint, then Properties. Choose (check) the following fields: type, ident, lat, long, y_proj, x_proj, comment, altitude & model. Click OK to dismiss the Properties window
  6. Click on Waypoint, then Download. All points collected will be downloaded.
  7. Click on File, then Save To, then ArcView, then Shapefile.
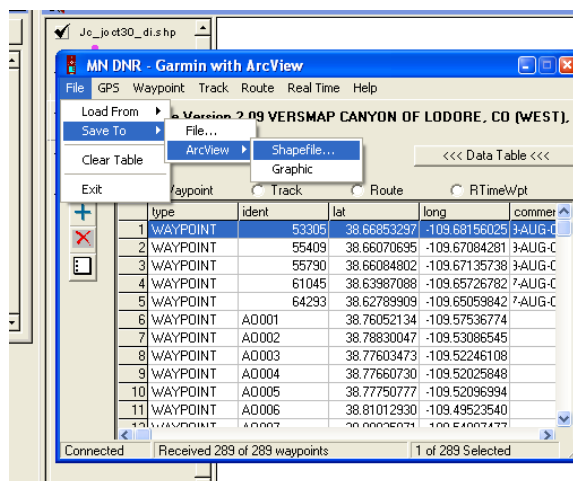

8. Navigate to the appropriate folder, and click Save. The newly created shapefile will appear in the active ArcView view window. Notice that X & Y coordinates have been added to the shapefile.

Land Bird Monitoring Protocol for the Park Units in the Northern Colorado Plateau Network

Standard Operating Procedure (SOP) # 4

Establishing and Marking Sampling Plots

Version 1.00 (December 15, 2004)

Revision History Log:

Prev. Version #	Revision Date	Author	Changes Made	Reason for Change	New Version #

Landbird monitoring in the Northern Colorado Plateau Network (NCPN) is conducted by Rocky Mountain Bird Observatory (RMBO), and is part of the Monitoring Colorado's Birds (MCB) program. This Standard Operating Procedure (SOP) describes the procedures used to select monitored habitat patches in NCPN park units, followed by a summary of the MCB procedures to select and mark bird-survey transects. The RMBO-MCB protocol is included as Appendix C in the NCPN Land Bird Monitoring Protocol narrative. Section IV and Appendix A in the RMBO-MCB protocol describes establishing and marking sampling plots.

I. Selecting Habitat Patches to Monitor

Sagebrush, pinyon-juniper, and riparian habitats will be monitored in NCPN park units. Thirty transects will be established in each habitat type. Park units included in landbird monitoring will be determined jointly by NCPN and RMBO early in 2005. Once determined, a systematic sample of upland habitat patches and riparian areas will be selected for monitoring. Transects will be located in the selected areas during the first monitoring visit. Coordinates of each transect will be recorded in this SOP in an attachment.

Procedures:

1. All patches of sagebrush and pinyon-juniper will be identified on land-cover maps from the Southwest Regional Re-GAP Analysis Project (http://fws-nmcfwru.nmsu.edu/SWREGAP/factsheet.htm). For each park included in landbird monitoring, the upland sampling frame will be overlaid on the land-cover maps, and the UTM coordinates of grid points (i.e., centroid of a grid cell) included in the two habitat types will be recorded. A sampling frame consists of a randomly oriented grid

of points spaced 50-150 meters apart, and serves as the basis for selecting monitoring locations for a number of vital signs in the NCPN monitoring effort (see Chapter 4 of the NCPN Monitoring Plan for details). Accessibility is included in the sampling frames for park units. Inaccessible areas are those that are surrounded by steep slopes, such as deep canyon bottoms, that can not be reached without the use of air transport or mountaineering. Accessible areas are those that can be reached by hiking. In generating the sampling frame, the slope-adjusted distance from a road is derived and stored for each accessible grid point on the landscape. In addition to recording the coordinates, the accessibility and slope-adjusted distance of grid points in the selected habitat patches will be recorded.

2. For each habitat type, a systematic sample of patches will be derived. Inaccessible habitat patches will be not be considered. Accessible patches will be assigned a selection probability that is used in deriving a systematic sample. Where all patches of a habitat are similarly accessible (e.g., within 1-2 km of a road), each grid point will be assigned the same probably of selection. Otherwise, unequal probabilities will be assigned. Unequal probabilities may be assigned using distance classes (e.g., $\leq$2-km, >2-km), with high-access areas having a higher selection probability. Alternatively, probabilities may be simply based on the inverse of distance. With selection probabilities assigned, standard methods will be employed to select a systematic sample (e.g., Lohr 1999). Inference of this monitoring protocol is to be made at the level of habitat types, not at the park level. Thus, the target population will be the sum of all patches of a habitat type across the selected park units. This aggregate of patches will serve as the basis from which a systematic sample is derived. A systematic sample initially will be constrained to have one transect per habitat patch. Where habitat patches are too few or very large, multiple transects per patch will be selected. Selected patches for each habitat type will be documented, and used in the following standard MCB procedures for locating transects.

3. Riparian habitats with perennial streams will be identified on GIS stream-layer coverages which are currently being updated by the NCPN. The site-selection procedure used for upland habitats will be attempted. However, alternative methods may be required given the linear nature and length of riparian areas. Once these methods have been developed, they will be documented in this SOP.

II. Establishing Sampling Plots

Park-based maps will be generated showing the selected habitat patches. Maps will include transportation networks to aid in navigating to possible access points. Aided by these maps, use the following RMBO-MCB procedures to locate and document bird-monitoring transects.

Procedures:

1. Determine an access point adjacent to or within the habitat patch to be surveyed that is easily recognizable, requires the least amount of driving to get to, and offers a safe parking place off of the road. For linear habitats, the access point is strategically placed near the end of the habitat to accommodate the entire length of a 15-point (requires approximately 4 km). Directions to the access point should be clear, detailed, and the UTM coordinates of its location should be recorded using a GPS unit. This information is recorded on the Rocky Mountain Bird Observatory – UTM Data Sheet (Attachment A). Instructions for recording this information are provided in Attachment B (SITE DATA).

2. The procedure for locating the first point-count station from the access point will vary depending on how close the access point is to the target habitat. For access points in or adjacent to the target habitat, a random number table is used for both the distance and the bearing for heading into the stand to get to the start of a transect. For access points far from the target habitat, walk the most direct bearing to the target habitat, and upon reaching it, establish the first point-count station.

3. Transect orientation follows the initial randomly selected bearing from the access point to the habitat patch. An exception is when monitoring linear habitats, such as riparian areas. In such cases, the transect is located in the middle of the habitat and follows the orientation of the habitat. When the transect runs into another habitat or a barrier (e.g., cliff, private property), specific instructions are detailed in the RMBO-MCB protocol for how to proceed (see Section IV., part A of the RMBO-MCB protocol in Appendix C of the NCPN Land Bird Monitoring Protocol Narrative). The 15 point-count stations should be spaced 250-m apart, using the "way-points" feature on the GPS unit to ensure the correct straight-line distance. Use of straight-line distance will result in actual walking distances through meandering linear habitats to be >250 m. Pacing will give a reasonable estimate of distance while hiking between points, but should not replace the use of a GPS unit to establish the exact point location.   The UTM coordinates of each point-count station should be recorded in the GPS (see SOP #3 for GPS instructions) and on the UTM Data Sheet (Attachment A) following the instructions listed in Attachment B (TRANSECT DATA – UTM data.).

III. Marking Sampling Plots

The MCB protocol does not call for permanent marking of transects. Observers rely on a GPS unit to re-locate UTM coordinates for the survey points, as well as between-point narrative accounts describing topography, habitat, landmarks, or other notable features of the landscape to help identify the point.

Attachment B
Explanation of Field Form and Data Codes
(Appendix A, Point Transect Protocol for Monitoring Colorado's Birds - RMBO)

(These instructions apply to the Rocky Mountain Bird Observatory – UTM Data Sheet)

<u>SITE DATA</u> (at top of page 1)

Transect #: Enter the **four-character** transect number using the ***correct* habitat codes** as described below (e.g., MS01, for Montane Shrubland #01, **not** MS1);

Observer: Enter your first two initials *and your full last name*

Map coord.: Enter the map coordinates for the transect Access Point, using either or both the *DeLorme* or *Roads of Colorado* atlases

Directions to access point (VERY IMPORTANT!): ***Provide explicit directions*** to the access point from some nearby town, major intersection, or geographical feature readily found on a *DeLorme* or *Roads of Colorado* atlas. Provide mileages from intersections or other landmarks using your odometer. **If the observer last year did not provide adequate directions to your site,** *please provide better directions this year*. For new sites (*or for those lacking Access Point UTM coordinates*), take GPS readings and record **UTM coordinates** (and stored GPS waypoint#) for each access point. Also, **be explicit in your description about the *exact location* of the access point** (e.g., "the right post of the green metal gate" or "the NE corner of the bridge").

Example: MS02: From jct. of Highway 61, head East on Happy Canyon Rd for 8.4 miles to jct. with 420 Rd. Head South on 420 Rd through narrow canyon for 2.1 miles, cross over wooden bridge and park in 1st pullout on right. Access point is the tall wooden post at the SW corner of the bridge.

Transect description: Provide the **distance** and **bearing** *from the access point **to** the first point* (do not provide bearing from first point back to the access point). Then, provide *between-point accounts*, describing the topography, habitat, landmarks and/or other features that you pass prior to arriving at the next count station, with sufficient detail so that future observers can follow the same route that you are establishing. *It is especially important that you record any turns, changes in bearings, or other deviations that you make from the original transect bearing.* Also, provide a brief description of the area surrounding the count station, or any noticeable features of the landscape at each point, again so future observers will know when they have reached the area of the point-count station. *As this is a long-term monitoring program, the importance of providing detailed directions/descriptions for each transect cannot be overstated!* GPS locations alone are not sufficiently reliable as the accuracy of GPS locations can be changed significantly by the U.S. Government (as happened after Sept. 11). Please provide the transect description information in the general format and detail as described in the following example.

Example: Pt#6: From pt 5, turn to 356 ^{o} and head down steep drainage. Stay on bearing, passing ~45 m to the right of drainage bottom, where drainage meets larger valley. Continue through small stand of aspen; cross dirt 2-track at ~175 m; cross small creek at ~225 m. After creek, head up small hill with tall spruce trees on top. Point is on top of this hill, ~3 m south of largest-diameter spruce.

TRANSECT DATA (middle of page 1)

Date: Enter the date in the format: MM-DD-YY

Time: Enter start and stop times for entire transect (not individual points) using 24-hour clock

Sky (start and end)**:** Enter one-digit codes at beginning and end of transect (not at points)
0=0-15% cloud cover   1=16-50% cloud cover   2=51-75% cloud cover
3=76-100% cloud cover   4=fog   6=drizzle
  You shouldn't conduct counts in any other conditions!

Wind (start and end)**:** Enter one-digit codes at beginning and end of transect
  0=Less than 1 mph; smoke rises vertically
  1=1-3 mph; smoke drift shows wind direction
  2=4-7 mph; leaves rustle, wind is felt on face
  3=8-12 mph; leaves, small twigs in constant motion; light flag extended
  4=13-18 mph; raises dust, leaves, loose paper; small branches in motion
  YOU SHOULDN'T CONDUCT COUNTS IN ANY OTHER CONDITIONS!

Temperature (start and end)**:** Use ^{o}F (no thermometer?, estimate to nearest 5°).

Transect notes: Enter information relevant to the site, good camp sites, cool scenery, or other tidbits that either don't really fit in other places or that future surveyors might find interesting.

UTM data: *Enter the UTM coordinates* (**using the NAD27 CONUS datum** *in* navigation setup) *for each point-count station associated with a **new** site* (*for established sites, only take a GPS reading if you are moving the count station; in these cases, provide new directions to the count station as well*). Be sure that the GPS reading is essentially stable before recording the UTM location. **Record all *new* UTM coordinates in the appropriate spaces provided on the field form and save all *new* UTM coordinates in the GPS units using the "Mark Waypoint" feature**. *Record the stored waypoint number, as indicated on the GPS unit, under "WP#", next to each UTM coordinate, respectively*. The stored UTM coordinates can then be uploaded to a PC, and thus you won't have to enter UTM coordinates as part of your data entry duties. However, each unit can only store 500 waypoints, so you will need to delete some of the established sites from the GPS unit (*after* completing the transect!) before you input additional locations. Whatever the situation, *make sure that **all** new UTMs get recorded on the field forms as well as in the GPS units!*

HABITAT DATA (bottom of page 1)

Within 100m of road (Y/N): Enter "Y" for yes and "N" for no for **EACH** point based on your best knowledge of the site. For our purposes, a "road" must be substantial enough so that it either causes a significant disruption of the understory vegetation OR a break in the canopy. For example, a grassy 2-track running through an open meadow should not be considered a road, whereas a gravel or dirt road that forms a 3 to 4-m wide break in the grass cover would be considered a road. Similarly, an old, pine needle-covered logging track in an open forest situation should not be considered a road, whereas a logging road that causes a clear and wide break in the woody understory vegetation, or in the forest canopy, should be considered a road. This topic will be covered more thoroughly during the training session.

On private land (Y/N): Enter "Y" for yes and "N" for no for **EACH** point. Be sure that you have permission to conduct counts that are on private land!

Bearing to point: Enter the true bearing (do not use magnetic bearings) you followed from the last point (or access point) to arrive at the current point.

Best habitat classification: Enter the two-letter code of the habitat that BEST describes the habitat surrounding the point count station. Consider the entire landscape around the count station from which you are picking up birds and select *the dominant habitat type that occupies the greatest amount of this area*.

Habitat classification codes:

AS = Aspen	LR = Low-elevation Riparian	RA = Rural/Agriculature
AT = Alpine Tundra	MR = Mid-elevation Riparian	SA = Sage Shrubland
CR = Cliff/Rock	MC = Mixed Conifer	SE = Semi-desert Shrubland
GR = Grassland	MS = Montane Shrubland	SB = Shore/Bank
HR = High-elevation Riparian	PJ = Piñon-Juniper	SF = Spruce-Fir
LP = Lodgepole Pine	PP = Ponderosa Pine	WE = Wetland

Best habitat seral stage and canopy closure: Enter one-digit code of seral stage (see Appendix D for habitat-specific seral stage accounts) of habitat used in best habitat classification, followed by a one-letter code for canopy closure:

1=grass-forb stage   2=shrub-seedling stage   3=sapling-pole stage

4=mature stage   5=old growth stage

a=<40% canopy closure   b=40-70% canopy closure   c=>70% canopy closure

Next-best habitat classification: Enter two-letter code of habitat that NEXT best describes the habitat surrounding the point. Consider the entire landscape from which you are picking up birds and select the next-most dominant habitat type occupying the

greatest amount of this area *OR* *select the habitat that is contributing the most birds to the point count* (if different than the Best Habitat).

Next-best habitat seral stage and canopy closure: Enter one-digit code of seral stage and one-letter code for canopy closure of habitat used in next-best habitat classification.

Primary understory classification: Enter two-letter code for primary understory vegetation type that best describes the understory within a 50-m radius of the point:

BG=bare ground	*GO=Gambel's oak*	*GF=grass/forb*
MM=mountain mahogany	*NS=not sage or willow*	*SA=sage*
SV=serviceberry	*SN=snowberry*	*WI=willow*

Primary understory percentage: Estimate the percent coverage of the primary understory type within a 50-m radius of point and enter the 1-digit code:
1=1-20%   2=21-40%   3=41-60%   4=61-80%   5=81-100%

Secondary understory classification: Enter two-letter code for secondary understory type that NEXT BEST describes the understory within a 50-m radius of the point, as described above.

Secondary understory percentage: Estimate the percent coverage of the secondary understory type within a 50-m radius of point and enter the 1-digit code, as described above.

(These instructions apply to the bird count data page of the Rocky Mountain Bird Observatory Point-Transect Form)

POINT-COUNT DATA

Point #: Enter number of point (01-15) on the transect; **NOTE:** for entries of target species *between points* enter "99" (see text on Transect counts).

Species: Enter **CORRECT** four-letter code for birds (see Appendix C); PLEASE, PLEASE use correct codes, as it makes data entry and analysis easier. Species that cause particular problems for observers include: **Northern Shoveler** (NSHO, not NOSH), Ring-necked Pheasant (RINP, not RNPH), **Western Wood-Pewee** (WEWP, not WWPE), **Gray Jay** (GRAJ, not GRJA), **Tree Swallow** (TRES, not TRSW), **Bank Swallow** (BANS, not BASW), **Barn Swallow** (BARS, not BASW), **MacGillivray's Warbler** (MGWA, not MAWA), **Yellow Warbler** (YWAR, not YEWA), **Yellow-rumped Warbler** (AUWA - for Audubon's Warbler, MYWA for Myrtle's Warbler, not YRWA), **Lark Bunting** (LARB, not LABU), **Sage Sparrow** (SAGS, not SASP), **Savannah Sparrow** (SAVS, not SASP), **Lazuli Bunting** (LAZB, not LABU) and **Red-winged Blackbird** (RWBL, not RWBB).

Radial distance: Measure radial distance (estimate only when necessary) to *each* bird (that is, direct distance from point to bird), using a binocular rangefinder, in one-meter units (when estimating, **DO NOT** round off to five- or ten-meter units) -- if beyond a kilometer (1000 meters), fit number in the three spaces provided as best you can.

Bearing: When recording low-density target species on point counts and in between points, use your declination-adjusted compass to site in the direction of the bird and record the true bearing (as opposed to magnetic) to the bird.

How: Enter code for how each individual was **detected**: C=calling, S=singing, D=drumming, O=other aural cue; V=visual; F=flyover; K=flock

Sex: Enter code for sex: M=male, F=female, U=unknown

VERY IMPORTANT: Skip a line between entries for individual points and/or individual legs of the transect. That is, all individual birds on a particular point (or transect leg) should be bunched together on the form; then you should leave a blank line before starting entries for the next transect leg (or point).

OTHER IMPORTANT REMINDERS:

Before leaving your transect sites, don't forget to:

- *enter transect and page #'s at the bottom of EACH page!*
- *record the end of transect data (time, temp, sky, wind, transect notes) IMMEDIATELY UPON COMPLETING THE TRANSECT!*
- *go through your data sheets <u>carefully</u> to make sure that you have not forgotten to record any data. Your work is not done until you've reviewed your data from the morning!*
- *provide clear and explicit directions to the access point, if you have not already done so!*

Land Bird Monitoring Protocol for the Park Units in the Northern Colorado Plateau Network

Standard Operating Procedure (SOP) #5

Conducting the Survey

Version 1.00 (December 15, 2004)

Revision History Log:

Prev. Version #	Revision Date	Author	Changes Made	Reason for Change	New Version #

This Standard Operating Procedure (SOP) summarizes the procedures for conducting landbird monitoring using the Rocky Mountain Bird Observatory (RMBO) *Monitoring Colorado's Birds* (MCB) protocol. Landbird monitoring in the Northern Colorado Plateau Network (NCPN) park units will be conducted by RMBO. Observers should read the RMBO Protocol (Appendix C of the NCPN Land Bird Monitoring Protocol Narrative) for a complete, detailed description of survey methods. This SOP summarizes procedures for: 1) collecting bird-observation data; 2) filling in the Rocky Mountain Bird Observatory – UTM Data Sheet; and 3) filling in the front and back of the Rocky Mountain Bird Observatory Point-Transect Form.

I. General Survey Considerations

Procedures:

1. Seasonal Timing. Surveys must be conducted within a three-week window after all migratory species have returned to an area. Appropriate survey times for each transect in the NCPN will be determined and provided by RMBO.

2. Monitoring Methods. Monitoring employs a combination of point-count and transect distance sampling. Observations for the more common species are collected at 15 point-count stations (i.e., variable circular plots) distributed along a transect. Observations are made during a 5-minute period. Observations of low-density target species are continuously collected along the line transect while walking between point-count stations. Distance measures are recorded for all observed individuals. A list of low-density target species by habitat will be provided by RMBO (also see Appendix C of the NCPN Land Bird Monitoring Protocol Narrative), and will be updated to reflect the habitats monitored in the NCPN.

3. Permissible Weather Conditions. Surveys should only be conducted in weather conditions that allow for birds to be adequately heard and seen. Counts should be stopped if winds exceed 13-18 mph (raising dust, leaves, loose paper; small branches in motion) and if precipitation is exceeds a drizzle.

4. Time of Day: Surveys begin approximately one half hour before sunrise and end no later than 10:00 am.

5. Transect Documentation: For each established transect, directions to the access point, distance and bearing to the start of a transect, and waypoint coordinates (if appropriate) must be recorded on the Rocky Mountain Bird Observatory – UTM Data Sheet (Attachment A) prior to entering the field. This information is supplied by RMBO; the NCPN also stores this information (see SOP #7). For new transects, areas selected for monitoring (i.e., habitat patches or riparian corridors) are provided, and during the first visit, an access point, and the distance and bearing to the start of a transect must be determined and recorded (see SOP #4).

II. 5-Minute Point Counts

Procedures:

1. If a new transect, the habitat patch or riparian corridor to monitor is provided along with park maps showing roads and trails, and suggested access points. You must determine the most appropriate access point, record directions to this point, and record the bearing and distance from the access point to the start of the transect.   This information is recorded on the Rocky Mountain Bird Observatory – UTM Data Sheet form (Attachment A). Instructions for recording this information are provided in Attachment C - SITE DATA). UTM coordinates for all point-count stations also must be determined and recorded on this form (see Attachment C – TRANSECT DATA). Detailed instructions for locating and documenting a new transect are provided in SOP #4.

2. If an established transect, navigate to the access point, then to the start of the transect following the recorded directions. Always verify the directions and correct as necessary.   Also, verify the recorded UTM coordinates of each point-count station.

3. At each point-count station, record habitat data before recording bird observations. Instructions and data forms are provided in SOP #6.

4. After recording habitat data (where applicable), start the timepiece and begin recording the following information for all birds detected during a 5-minute count:
    - radial distance from you to the bird
    - how the bird was detected
    - sex of the bird (if known)
    - the bearing from you to the bird, if a low-density target species

Observations are recorded on the Rocky Mountain Bird Observatory Point-transect Form (Attachment B) following the instructions provided in Attachment C (POINT-COUNT DATA).

III. Line Transect Component of the 5-Minute Point Counts

Conduct a continuous transect count between the first and last points of the transect, recording all detections of low-density target species. It is important to note that low-density target species also are recorded at point-count stations.

Procedures:

For each low-density target species detected, record:

- radial distance from you to the bird
- bearing from you to the bird
- how the bird was detected
- sex of the bird (if known)

Observations are recorded on the Rocky Mountain Bird Observatory Point-Transect Form (Attachment B) following the instructions provided in Attachment C (POINT-COUNT DATA).

IV. Potential Problems

Observers should pay specific attention to the following topics when reviewing the RMBO protocol (see Appendix C of the NCPN Land Bird Monitoring Protocol Narrative):

- how to distinguish flyovers
- how to determine the correct distance measure for birds which move during the survey
- how to estimate radial distances, especially for birds heard but not seen
- why not to round distance estimates
- how to adjust bearings for proper declination
- the need to avoid recording birds seen or heard previously
- sources of observer error (see Section VII in Appendix C)

Attachment C
Explanation of Field Form and Data Codes
(Appendix A, Point Transect Protocol for Monitoring Colorado's Birds - RMBO)

(These instructions apply to the Rocky Mountain Bird Observatory – UTM Data Sheet)

<u>**SITE DATA**</u> (at top of page 1)

<u>***Transect #***</u>**:** Enter the **four-character** transect number using the ***correct*** **habitat codes** as described below (e.g., MS01, for Montane Shrubland #01, **not** MS1);

<u>**Observer:**</u> Enter your first two initials *and your full last name*

<u>*Map coord.:*</u> Enter the map coordinates for the transect Access Point, using either or both the *DeLorme* or *Roads of Colorado* atlases

<u>***Directions to access point (VERY IMPORTANT!)***</u>**:** ***Provide explicit directions*** to the access point from some nearby town, major intersection, or geographical feature readily found on a *DeLorme* or *Roads of Colorado* atlas. Provide mileages from intersections or other landmarks using your odometer. **If the observer last year did not provide adequate directions to your site,** *please provide better directions this year***.** For new sites (*or for those lacking Access Point UTM coordinates*), take GPS readings and record <u>**UTM coordinates**</u> (and stored GPS waypoint#) for each access point. Also, **be explicit in your description about the** *exact location* **of the access point** (e.g., "the right post of the green metal gate" or "the NE corner of the bridge").

Example: MS02: From jct. of Highway 61, head East on Happy Canyon Rd for 8.4 miles to jct. with 420 Rd. Head South on 420 Rd through narrow canyon for 2.1 miles, cross over wooden bridge and park in 1st pullout on right. Access point is the tall wooden post at the SW corner of the bridge.

<u>***Transect description***</u>**:** Provide the **distance** and **bearing** *from the access point* **to** *the first point* (do not provide bearing from first point back to the access point). Then, provide *between-point accounts*, describing the topography, habitat, landmarks and/or other features that you pass prior to arriving at the next count station, with sufficient detail so that future observers can follow the same route that you are establishing. *It is especially important that you record any turns, changes in bearings, or other deviations that you make from the original transect bearing.* Also, provide a brief description of the area surrounding the count station, or any noticeable features of the landscape at each point, again so future observers will know when they have reached the area of the point-count station. *As this is a long-term monitoring program, the importance of providing detailed directions/descriptions for each transect cannot be overstated!* GPS locations alone are not sufficiently reliable as the accuracy of GPS locations can be changed significantly by the U.S. Government (as happened after Sept. 11). Please provide the transect description information in the general format and detail as described in the following example.

Example: Pt#6: From pt 5, turn to 356° and head down steep drainage. Stay on bearing, passing ~45 m to the right of drainage bottom, where drainage meets larger valley. Continue through small stand of aspen; cross dirt 2-track at ~175 m; cross small creek at ~225 m. After creek, head up small hill with tall spruce trees on top. Point is on top of this hill, ~3 m south of largest-diameter spruce.

TRANSECT DATA (middle of page 1)

Date: Enter the date in the format: MM-DD-YY

Time: Enter start and stop times for entire transect (not individual points) using 24-hour clock

Sky (start and end)**:** Enter one-digit codes at beginning and end of transect (not at points)
0=0-15% cloud cover   1=16-50% cloud cover   2=51-75% cloud cover
3=76-100% cloud cover   4=fog   6=drizzle
   You shouldn't conduct counts in any other conditions!

Wind (start and end)**:** Enter one-digit codes at beginning and end of transect
   0=Less than 1 mph; smoke rises vertically
   1=1-3 mph; smoke drift shows wind direction
   2=4-7 mph; leaves rustle, wind is felt on face
   3=8-12 mph; leaves, small twigs in constant motion; light flag extended
   4=13-18 mph; raises dust, leaves, loose paper; small branches in motion
   YOU SHOULDN'T CONDUCT COUNTS IN ANY OTHER CONDITIONS!

Temperature (start and end)**:** Use ^{o}F (no thermometer?, estimate to nearest 5°).

Transect notes: Enter information relevant to the site, good camp sites, cool scenery, or other tidbits that either don't really fit in other places or that future surveyors might find interesting.

UTM data: *Enter the UTM coordinates* (**using the NAD27 CONUS datum** in navigation setup) *for each point-count station associated with a **new** site* (*for established sites, only take a GPS reading if you are moving the count station; in these cases, provide new directions to the count station as well*). Be sure that the GPS reading is essentially stable before recording the UTM location. **Record all *new* UTM coordinates in the appropriate spaces provided on the field form and save all *new* UTM coordinates in the GPS units using the "Mark Waypoint" feature**. *Record the stored waypoint number, as indicated on the GPS unit, under "WP#", next to each UTM coordinate, respectively.* The stored UTM coordinates can then be uploaded to a PC, and thus you won't have to enter UTM coordinates as part of your data entry duties. However, each unit can only store 500 waypoints, so you will need to delete some of the established sites from the GPS unit (*after* completing the transect!) before you input additional locations. Whatever the situation, *make sure that **all** new UTMs get recorded on the field forms as well as in the GPS units!*

HABITAT DATA (bottom of page 1)

Within 100m of road (Y/N): Enter "Y" for yes and "N" for no for **EACH** point based on your best knowledge of the site. For our purposes, a "road" must be substantial enough so that it either causes a significant disruption of the understory vegetation OR a break in the canopy. For example, a grassy 2-track running through an open meadow should not be considered a road, whereas a gravel or dirt road that forms a 3 to 4-m wide break in the grass cover would be considered a road. Similarly, an old, pine needle-covered logging track in an open forest situation should not be considered a road, whereas a logging road that causes a clear and wide break in the woody understory vegetation, or in the forest canopy, should be considered a road. This topic will be covered more thoroughly during the training session.

On private land (Y/N): Enter "Y" for yes and "N" for no for **EACH** point. Be sure that you have permission to conduct counts that are on private land!

Bearing to point: Enter the true bearing (do not use magnetic bearings) you followed from the last point (or access point) to arrive at the current point.

Best habitat classification: Enter the two-letter code of the habitat that BEST describes the habitat surrounding the point count station. Consider the entire landscape around the count station from which you are picking up birds and select *the dominant habitat type that occupies the greatest amount of this area*.

Habitat classification codes:

AS = Aspen	LR = Low-elevation Riparian	RA = Rural/Agriculature
AT = Alpine Tundra	MR = Mid-elevation Riparian	SA = Sage Shrubland
CR = Cliff/Rock	MC = Mixed Conifer	SE = Semi-desert Shrubland
GR = Grassland	MS = Montane Shrubland	SB = Shore/Bank
HR = High-elevation Riparian	PJ = Piñon-Juniper	SF = Spruce-Fir
LP = Lodgepole Pine	PP = Ponderosa Pine	WE = Wetland

Best habitat seral stage and canopy closure: Enter one-digit code of seral stage (see Appendix D for habitat-specific seral stage accounts) of habitat used in best habitat classification, followed by a one-letter code for canopy closure:

1=grass-forb stage   2=shrub-seedling stage   3=sapling-pole stage

4=mature stage   5=old growth stage

   a=<40% canopy closure   b=40-70% canopy closure   c=>70% canopy closure

Next-best habitat classification: Enter two-letter code of habitat that NEXT best describes the habitat surrounding the point. Consider the entire landscape from which you are picking up birds and select the next-most dominant habitat type occupying the

greatest amount of this area *OR* *select the habitat that is contributing the most birds to the point count* (if different than the Best Habitat).

Next-best habitat seral stage and canopy closure: Enter one-digit code of seral stage and one-letter code for canopy closure of habitat used in next-best habitat classification.

Primary understory classification: Enter two-letter code for primary understory vegetation type that best describes the understory within a 50-m radius of the point:

BG=bare ground	*GO=Gambel's oak*	*GF=grass/forb*
MM=mountain mahogany	*NS=not sage or willow*	*SA=sage*
SV=serviceberry	*SN=snowberry*	*WI=willow*

Primary understory percentage: Estimate the percent coverage of the primary understory type within a 50-m radius of point and enter the 1-digit code:
> *1=1-20%   2=21-40%   3=41-60%   4=61-80%   5=81-100%*

Secondary understory classification: Enter two-letter code for secondary understory type that NEXT BEST describes the understory within a 50-m radius of the point, as described above.

Secondary understory percentage: Estimate the percent coverage of the secondary understory type within a 50-m radius of point and enter the 1-digit code, as described above.

(These instructions apply to the bird count data page of the Rocky Mountain Bird Observatory Point-Transect Form)

POINT-COUNT DATA

Point #: Enter number of point (01-15) on the transect; **NOTE:** for entries of target species *between points* enter "99" (see text on Transect counts).

Species: Enter **CORRECT** four-letter code for birds (see Appendix C); PLEASE, PLEASE use correct codes, as it makes data entry and analysis easier. Species that cause particular problems for observers include: **Northern Shoveler** (NSHO, not NOSH), Ring-necked Pheasant (RINP, not RNPH), **Western Wood-Pewee** (WEWP, not WWPE), **Gray Jay** (GRAJ, not GRJA), **Tree Swallow** (TRES, not TRSW), **Bank Swallow** (BANS, not BASW), **Barn Swallow** (BARS, not BASW), **MacGillivray's Warbler** (MGWA, not MAWA), **Yellow Warbler** (YWAR, not YEWA), **Yellow-rumped Warbler** (AUWA - for Audubon's Warbler, MYWA for Myrtle's Warbler, not YRWA), **Lark Bunting** (LARB, not LABU), **Sage Sparrow** (SAGS, not SASP), **Savannah Sparrow** (SAVS, not SASP), **Lazuli Bunting** (LAZB, not LABU) and **Red-winged Blackbird** (RWBL, not RWBB).

Radial distance: Measure radial distance (estimate only when necessary) to *each* bird (that is, direct distance from point to bird), using a binocular rangefinder, in one-meter units (when estimating, **DO NOT** round off to five- or ten-meter units) -- if beyond a kilometer (1000 meters), fit number in the three spaces provided as best you can.

Bearing: When recording low-density target species on point counts and in between points, use your declination-adjusted compass to site in the direction of the bird and record the true bearing (as opposed to magnetic) to the bird.

How: Enter code for how each individual was **detected**: C=calling, S=singing, D=drumming, O=other aural cue; V=visual; F=flyover; K=flock

Sex: Enter code for sex: M=male, F=female, U=unknown

VERY IMPORTANT: Skip a line between entries for individual points and/or individual legs of the transect. That is, all individual birds on a particular point (or transect leg) should be bunched together on the form; then you should leave a blank line before starting entries for the next transect leg (or point).

OTHER IMPORTANT REMINDERS:

Before leaving your transect sites, don't forget to:

- *enter transect and page #'s at the bottom of EACH page!*
- *record the end of transect data (time, temp, sky, wind, transect notes) IMMEDIATELY UPON COMPLETING THE TRANSECT!*
- *go through your data sheets carefully to make sure that you have not forgotten to record any data. Your work is not done until you've reviewed your data from the morning!*
- *provide clear and explicit directions to the access point, if you have not already done so!*

**Land Bird Monitoring Protocol for the Park Units in the
Northern Colorado Plateau Network**

Standard Operating Procedure (SOP) # 6

Documenting Habitat Variables

Version 1.00 (December 15, 2004)

Revision History Log:

Prev. Version #	Revision Date	Author	Changes Made	Reason for Change	New Version #

Landbird monitoring in the Northern Colorado Plateau Network (NCPN) is conducted by Rocky Mountain Bird Observatory (RMBO), and is part of the Monitoring Colorado's Birds (MCB) program. This Standard Operating Procedure (SOP) summarizes habitat-data collection procedures of the MCB protocol. Habitat data are collected only at point-count stations on upland transects. Data are collected upon reaching a point-count station prior to bird counts. Habitat data are collected annually. Two sets of habitat data are collected according to protocols developed in 2000 and in 2004. Data forms and detailed instructions are included in this SOP as attachments.

Procedures:

1. The 2000 protocol requires collecting habitat data at both the landscape scale and within a 50-m radius circular plot centered on a point-count survey point. Specific instructions are provided in Appendix A, part 3, and Appendix E of the RMBO *Point Transect Protocol for Monitoring Colorado's Birds* (see Appendix C of the NCPN Land Bird Monitoring Protocol Narrative). The habitat data section of the Rocky Mountain Bird Observatory UTM Data Sheet (Attachment A) records landscape and 50-m radius habitat information. Following RMBO instructions for the data sheet (Attachment B – HABITAT DATA) and the guidelines for classifying habitat (Attachment C), record the following attributes:

   - Landscape Attributes
     - Dominant habitat: type, seral stage, canopy closure
     - Next-most dominant habitat: type, seral stage, canopy closure
   - 50-m Radius Plot Attributes
     - Primary understory: classification, percent cover
     - Secondary understory: classification, percent cover

2. The 2004 protocol requires collecting seral-stage and canopy-cover data within a 50-m radius circular plot centered on a bird-survey point. This information is recorded in the habitat page of the Rocky Mountain Bird Observatory Point-Transect Form (Attachment D). Specific instructions are provided in Attachment E of this SOP. Following RMBO instructions, record the following habitat attributes at each bird-survey point:

- Overstory
  - seral (structural) stage
  - canopy closure
  - canopy tree height
  - dominant tree species (up to 5)
  - relative percent of overstory occupied by each dominant species
  - additional habitats present

- Sub-canopy/ mid-story
  - foliage mass (volume) of middle vertical third of the forest
  - distinct sub-canopy tree species

- Shrub layer
  - foliage mass (volume) of all woody shrubs and seedling trees
  - mean height of the shrub layer
  - shrub and tree seedling species (up to 5)
  - relative percent of total shrub layer occupied by each species

- Ground cover
  - absolute percent of ground cover in each of 4 categories: woody, herbaceous, grass, bare ground.

Attachment A - **Rocky Mountain Bird Observatory – UTM Data Sheet**

(These instructions apply to the Rocky Mountain Bird Observatory – UTM Data Sheet)

<u>**SITE DATA**</u> (at top of page 1)

*<u>Transect #</u>***:** Enter the **four-character** transect number using the ***correct* habitat codes** as described below (e.g., MS01, for Montane Shrubland #01, **not** MS1);

<u>**Observer:**</u> Enter your first two initials *and your full last name*

<u>Map coord.:</u> Enter the map coordinates for the transect Access Point, using either or both the *DeLorme* or *Roads of Colorado* atlases

*<u>Directions to access point (VERY IMPORTANT!)</u>***: *Provide explicit directions*** to the access point from some nearby town, major intersection, or geographical feature readily found on a *DeLorme* or *Roads of Colorado* atlas. Provide mileages from intersections or other landmarks using your odometer. **If the observer last year did not provide adequate directions to your site,** *please provide better directions this year***.** For new sites (*or for those lacking Access Point UTM coordinates*), take GPS readings and record **<u>UTM coordinates</u>** (and stored GPS waypoint#) for each access point. Also, **be explicit in your description about the *exact location* of the access point** (e.g., "the right post of the green metal gate" or "the NE corner of the bridge").

Example: MS02: From jct. of Highway 61, head East on Happy Canyon Rd for 8.4 miles to jct. with 420 Rd. Head South on 420 Rd through narrow canyon for 2.1 miles, cross over wooden bridge and park in 1st pullout on right. Access point is the tall wooden post at the SW corner of the bridge.

*<u>Transect description</u>***:** Provide the **distance** and **bearing** *from the access point **to** the first point* (do not provide bearing from first point back to the access point). Then, provide *between-point accounts*, describing the topography, habitat, landmarks and/or other features that you pass prior to arriving at the next count station, with sufficient detail so that future observers can follow the same route that you are establishing. *It is especially important that you record any turns, changes in bearings, or other deviations that you make from the original transect bearing.* Also, provide a brief description of the area surrounding the count station, or any noticeable features of the landscape at each point, again so future observers will know when they have reached the area of the point-count station. *As this is a long-term monitoring program, the importance of providing detailed directions/descriptions for each transect cannot be overstated!* GPS locations alone are not sufficiently reliable as the accuracy of GPS locations can be changed significantly by the U.S. Government (as happened after Sept. 11). Please provide the transect description information in the general format and detail as described in the following example.

Example: Pt#6: From pt 5, turn to 356° and head down steep drainage. Stay on bearing, passing ~45 m to the right of drainage bottom, where drainage meets larger valley. Continue through small stand of aspen; cross dirt 2-track at ~175 m; cross small creek at ~225 m. After creek, head up small hill with tall spruce trees on top. Point is on top of this hill, ~3 m south of largest-diameter spruce.

TRANSECT DATA (middle of page 1)

Date: Enter the date in the format: MM-DD-YY

Time: Enter start and stop times for entire transect (not individual points) using 24-hour clock

Sky (start and end)**:** Enter one-digit codes at beginning and end of transect (not at points)
0=0-15% cloud cover   *1=16-50% cloud cover*   *2=51-75% cloud cover*
3=76-100% cloud cover   *4=fog*   *6=drizzle*
  You shouldn't conduct counts in any other conditions!

Wind (start and end)**:** Enter one-digit codes at beginning and end of transect
  0=Less than 1 mph; smoke rises vertically
  1=1-3 mph; smoke drift shows wind direction
  2=4-7 mph; leaves rustle, wind is felt on face
  3=8-12 mph; leaves, small twigs in constant motion; light flag extended
  4=13-18 mph; raises dust, leaves, loose paper; small branches in motion
  YOU SHOULDN'T CONDUCT COUNTS IN ANY OTHER CONDITIONS!

Temperature (start and end)**:** Use ^{o}F (no thermometer?, estimate to nearest 5°)

Transect notes: Enter information relevant to the site, good camp sites, cool scenery, or other tidbits that either don't really fit in other places or that future surveyors might find interesting.

UTM data: *Enter the UTM coordinates* (**using the NAD27 CONUS datum** in navigation setup) *for each point-count station associated with a **new** site* (*for established sites, only take a GPS reading if you are moving the count station; in these cases, provide new directions to the count station as well*). Be sure that the GPS reading is essentially stable before recording the UTM location. **Record all *new* UTM coordinates in the appropriate spaces provided on the field form and save all *new* UTM coordinates in the GPS units using the "Mark Waypoint" feature**. *Record the stored waypoint number, as indicated on the GPS unit, under "WP#", next to each UTM coordinate, respectively*. The stored UTM coordinates can then be uploaded to a PC, and thus you won't have to enter UTM coordinates as part of your data entry duties. However, each unit can only store 500 waypoints, so you will need to delete some of the established sites from the GPS unit (*afte*r completing the transect!) before you input additional locations. Whatever the situation, *make sure that **all** new UTMs get recorded on the field forms as well as in the GPS units!*

HABITAT DATA (bottom of page 1)

Within 100m of road (Y/N): Enter "Y" for yes and "N" for no for **EACH** point based on your best knowledge of the site. For our purposes, a "road" must be substantial enough so that it either causes a significant disruption of the understory vegetation OR a break in the canopy. For example, a grassy 2-track running through an open meadow should not be considered a road, whereas a gravel or dirt road that forms a 3 to 4-m wide break in the grass cover would be considered a road. Similarly, an old, pine needle-covered logging track in an open forest situation should not be considered a road, whereas a logging road that causes a clear and wide break in the woody understory vegetation, or in the forest canopy, should be considered a road. This topic will be covered more thoroughly during the training session.

On private land (Y/N): Enter "Y" for yes and "N" for no for **EACH** point. Be sure that you have permission to conduct counts that are on private land!

Bearing to point: Enter the true bearing (do not use magnetic bearings) you followed from the last point (or access point) to arrive at the current point.

Best habitat classification: Enter the two-letter code of the habitat that BEST describes the habitat surrounding the point count station. Consider the entire landscape around the count station from which you are picking up birds and select *the dominant habitat type that occupies the greatest amount of this area*.

Habitat classification codes:

AS = Aspen	LR = Low-elevation Riparian	RA = Rural/Agriculature
AT = Alpine Tundra	MR = Mid-elevation Riparian	SA = Sage Shrubland
CR = Cliff/Rock	MC = Mixed Conifer	SE = Semi-desert Shrubland
GR = Grassland	MS = Montane Shrubland	SB = Shore/Bank
HR = High-elevation Riparian	PJ = Piñon-Juniper	SF = Spruce-Fir
LP = Lodgepole Pine	PP = Ponderosa Pine	WE = Wetland

Best habitat seral stage and canopy closure: Enter one-digit code of seral stage (see Appendix D for habitat-specific seral stage accounts) of habitat used in best habitat classification, followed by a one-letter code for canopy closure:

1=grass-forb stage   2=shrub-seedling stage   3=sapling-pole stage

4=mature stage   5=old growth stage

   a=<40% canopy closure   b=40-70% canopy closure   c=>70% canopy closure

Next-best habitat classification: Enter two-letter code of habitat that NEXT best describes the habitat surrounding the point. Consider the entire landscape from which you are picking up birds and select the next-most dominant habitat type occupying the

greatest amount of this area *OR* *select the habitat that is contributing the most birds to the point count* (if different than the Best Habitat).

Next-best habitat seral stage and canopy closure: Enter one-digit code of seral stage and one-letter code for canopy closure of habitat used in next-best habitat classification.

Primary understory classification: Enter two-letter code for primary understory vegetation type that best describes the understory within a 50-m radius of the point:

BG=bare ground	*GO=Gambel's oak*	*GF=grass/forb*
MM=mountain mahogany	*NS=not sage or willow*	*SA=sage*
SV=serviceberry	*SN=snowberry*	*WI=willow*

Primary understory percentage: Estimate the percent coverage of the primary understory type within a 50-m radius of point and enter the 1-digit code:
       1=1-20%   2=21-40%   3=41-60%   4=61-80%   5=81-100%

Secondary understory classification: Enter two-letter code for secondary understory type that NEXT BEST describes the understory within a 50-m radius of the point, as described above.

Secondary understory percentage: Estimate the percent coverage of the secondary understory type within a 50-m radius of point and enter the 1-digit code, as described above.

(These instructions apply to the bird count data page of the Rocky Mountain Bird Observatory Point-Transect Form)

POINT-COUNT DATA

Point #: Enter number of point (01-15) on the transect; **NOTE:** for entries of target species *between points* enter "99" (see text on Transect counts).

Species: Enter **CORRECT** four-letter code for birds (see Appendix C); PLEASE, PLEASE use correct codes, as it makes data entry and analysis easier. Species that cause particular problems for observers include: **Northern Shoveler** (NSHO, not NOSH), Ring-necked Pheasant (RINP, not RNPH), **Western Wood-Pewee** (WEWP, not WWPE), **Gray Jay** (GRAJ, not GRJA), **Tree Swallow** (TRES, not TRSW), **Bank Swallow** (BANS, not BASW), **Barn Swallow** (BARS, not BASW), **MacGillivray's Warbler** (MGWA, not MAWA), **Yellow Warbler** (YWAR, not YEWA), **Yellow-rumped Warbler** (AUWA - for Audubon's Warbler, MYWA for Myrtle's Warbler, not YRWA), **Lark Bunting** (LARB, not LABU), **Sage Sparrow** (SAGS, not SASP), **Savannah Sparrow** (SAVS, not SASP), **Lazuli Bunting** (LAZB, not LABU) and **Red-winged Blackbird** (RWBL, not RWBB).

Radial distance: Measure radial distance (estimate only when necessary) to *each* bird (that is, direct distance from point to bird), using a binocular rangefinder, in one-meter units (when estimating, **DO NOT** round off to five- or ten-meter units) -- if beyond a kilometer (1000 meters), fit number in the three spaces provided as best you can.

Bearing: *When recording low-density target species on point counts and in between points, use your declination-adjusted compass to site in the direction of the bird and record the true bearing (as opposed to magnetic) to the bird.*

How: Enter code for how each individual was **detected**: C=calling, S=singing, D=drumming, O=other aural cue; V=visual; F=flyover; K=flock

Sex: Enter code for sex: M=male, F=female, U=unknown

VERY IMPORTANT: Skip a line between entries for individual points and/or individual legs of the transect. That is, all individual birds on a particular point (or transect leg) should be bunched together on the form; then you should leave a blank line before starting entries for the next transect leg (or point).

OTHER IMPORTANT REMINDERS:
Before leaving your transect sites, don't forget to:
- *enter transect and page #'s at the bottom of EACH page!*
- *record the end of transect data (time, temp, sky, wind, transect notes) IMMEDIATELY UPON COMPLETING THE TRANSECT!*
- *go through your data sheets <u>carefully</u> to make sure that you have not forgotten to record any data. Your work is not done until you've reviewed your data from the morning!*
- *provide clear and explicit directions to the access point, if you have not already done so!*

Attachment C

Guidelines for Classifying Habitat, Seral Stage, and Canopy Closure
(Appendix E, Point Transect Protocol for Monitoring Colorado's Birds - RMBO)

The following characteristics can generally define the various seral stages of the habitats listed below. However, they are intended to be used as a guide, not gospel. Variability among sites is to be expected depending on geographic location, elevation, aspect, slope, soil quality and other site characteristics. Therefore, you must still use your head when judging seral stage. All data regarding habitat should be recorded on page 1 of the field form *prior to beginning each point count*.

Estimating Canopy Closure

For all habitats (other than MG) in seral stages 2-5, canopy closure should also be assessed **at each point count station** using the following codes:

a = canopy closure < 40% b = canopy closure 40-70% c = canopy closure > 70%

Canopy closure should be assessed based on the openness of the canopy for both the primary and secondary habitats selected at each point. Ex. = a mature stand of ponderosa pine with greater than 70% of sky obscured by canopy vegetation should be classified as '4c'.

Assessing Habitat and Seral Stage in Selected Habitats

Aspen (AS)

AS Habitat Description:
AS habitat consists of small or large forested stands dominated by quaking aspen. AS stands are generally not monotypic; other tree species that frequently occur within or adjacent to AS include, from lower to higher elevations, Ponderosa Pine, White Fir, Blue Spruce, Douglas-fir, Lodgepole Pine, Englemann Spruce, and Subalpine Fir. Some AS stands have a woody understory of a variety of species, depending upon location, elevation, and other factors. These understory species can include Common Juniper, Mountain Mahogany, Big Sage, Snowberry, Serviceberry, among others. Other stands have only herbaceous under-stories.

AS Seral Stage Assessment:
    1 = Grass-Forb stage: Grasses and forbs dominate; aspen suckers/saplings are absent.
    2 = Shrub-Seedling stage: Suckers/saplings are present, up to 2 inches dbh and 4 m in height. Stem density can vary from 5,000 to 40,000 stems per acre.
    3 = Sapling-Pole stage: Saplings between 2 and 8 inches dbh and up to 6-13 m in height on good sites; on poorer sites trees may never reach 8 inches dbh and may be shorter than 6 m, with crooked and twisted boles.

4 = Mature stage: Trees > 8 inches dbh; on better sites, trees between 16-24 inches dbh and 28-33 m in height. Typically, there is a high density of grass, forbs
and shrubs in the understory. Snags are also generally common in this stage.
5 = Old-Growth stage: Large diameter trees and many snags are present, as are diseased trees and downed material. Snags may occur in large groups in this stage.

Ponderosa Pine (PP)

PP Habitat Description:
PP habitat is forest dominated by, amazingly, Ponderosa Pine, often in pure stands, but there are often admixtures of Aspen, White Fir, Douglas-fir, and/or Blue Spruce and the habitat can intergrade at its upper elevational level with Lodgepole Pine. The habitat occurs primarily between 5500' and about 8500', though it can occur at slightly higher elevations in some places. In some places, particularly in South Park, Ponderosa Pine and Limber Pine co-occur. However, habitats designated PP should consist primarily of Ponderosa Pine; habitats with any significant admixture (>20%) of some other conifer should be called Mixed Conifer (MC). The habitat often has a well-developed woody under-story, though historic burn frequencies kept most stands fairly open with large, widely-spaced trees. In areas where fire has been excluded, a significant Gambel Oak understory often develops and these areas can host large numbers of shrub-dependent species, e.g., Green-tailed and Spotted towhees and Dusky Flycatcher.

PP Seral Stage Assessment:
1 = Grass-Forb stage: Grasses and forbs dominate; pine seedlings and shrubs scarce or absent. This stage usually results from fire and/or logging.
2 = Shrub-Seedling stage: Small pine saplings, <=1 inch dbh, and a variety of woody shrubs small deciduous trees are present, as well as herbs. Litter and downed material may exist.
3 = Sapling-Pole stage: Trees 1-8 inches dbh, 3-17 m in height; age of stand 6-50 yrs old. Stands in this stage can be quite dense, normally exceeding 70% canopy closure, and are typically even aged. Some small diameter snags may be present.
4 = Mature stage: Avg. dbh of trees >8 inches. Stand may be multi-layered, and snags suitable in size for most cavity-nesting birds should be present. Oak layer, if present, is usually well developed.
5 = Old-Growth stage: Avg. dbh of dominant trees >8 inches, with some trees between 30 to 60 inches; stand typically of uneven age, woody understory is extensive and well-developed; canopy and stand structure generally open; numerous large snags, dying trees, and downfall present.

Spruce-Fir (SF)

SF Habitat Description:
SF habitat refers to areas dominated by Englemann Spruce and Subalpine Fir. This habitat typically occurs at elevations above 8000'. This habitat often mixes with

Lodgepole Pine (LP), so be careful about the particular tree species present. These stands can be monotypic, but usually have admixtures of Aspen (AS).

SF Seral Stage Assessment:
   1 = Grass-Forb stage: Primarily herbaceous plants; no trees or saplings; near complete absence of downed litter or snags.
   2 = Shrub-Seedling stage: Spruce saplings up to 1 inch dbh are present.
   3 = Sapling-Pole stage: Stems 1-7 inches dbh, and; snags and downfall present.
   4 = Mature stage: Avg. dbh of trees >8 inches. Stand may be multi-layered, and snags suitable in size for most cavity-nesting birds should be present.
   5 = Old-Growth stage: Avg dbh of dominant trees > 22 inches; forest is typically multi-layered, with trees of varying age/size, significant amounts of accumulated downfall and numerous, randomly distributed snags. Grasses and forbs are relatively scarce, but epiphytic vegetation (mosses & lichens) is prevalent.

Changes to the RMBO Monitoring Program Vegetation and Bird Count Protocols 2004 -RMBO

Weather data

Please see clipboard sheet for explanations of the various weather data requested: sky code, wind speed, and temperature.

Atlas page and location

Enter the page number on which the Access Point of the current transect is located – putting this value in the correct set of boxes (either the De Lorme atlas or the "Roads of" atlas). Then enter the horizontal and vertical grid reference of the Access Point of the current transect. ALWAYS list the letter first, regardless of whether letters make up the X axis or the Y axis of the maps. You may use "half-grids" to indicate points approximately halfway between either two numbers OR two letters, e.g., A.5-2 or C-3.5; use a hyphen to separate the two components of the value. If you are using only whole grid references, e.g., B1 or D7, then do NOT use a hyphen to separate the components.

GPS info

Unit # - Write the last four digits of the GPS unit number (from the silver sticker affixed to the unit) in the appropriate space.

Point # - Enter the saved waypoint number referable to the point at which you are standing (from the GPS unit) in the appropriate space.

Point info

<100m to road? - Enter 'Y' here if the point at which you are standing is within 100 meters of a road; otherwise, enter 'N'.

Private property? - (Not for Wyoming program) Enter 'Y' if the point at which you are standing is on private property; otherwise, enter 'N'.

Distance to edge - (For Wyoming program ONLY) Enter estimate or measured distance to nearest habitat edge.

Bearing to point – Enter the bearing (either from the Access Point or from the previous point) that you took to get TO the point at which you are standing.

Overstory

Seral (i.e., structural) stage - At each point-count station, identify and record the *average* structural stage of the <u>overstory trees</u> within a 50-m radius of the point-count station. Please use the following scale:

    1   grass-forb (i.e., no or very few overstory trees present)
    2   shrub-seedling (i.e., generally trees below head height)
    3   sapling-pole
    4   mature
    5   old-growth

Canopy Closure - Estimate the percent closure of the canopy trees within a 50-m radius of the point-count station and select the best choice from the following categories:

A   <40%
B   40-70%
C   >70%

Height - At each point-count station, estimate the average height of the canopy trees (in meters) within a 50-m radius circle to the nearest meter. Use a range finder to help gauge estimates.

Species Composition - Identify the dominant tree species in the overstory and record the *relative* percent of the total overstory occupied by each species within a 50-m radius of each point-count station; as many as five species may be listed. Note that if only one tree species is present in the overstory, the relative percent should be 100% (9), regardless of how much of the circle is occupied by the tree species. Tree species should be recorded on the data forms using the correct 2-letter vegetation code provided in the list. Please use the following scale for recording relative abundance of each overstory tree species:

    0   01-09%
    1   10-19%
    2   20-29%
    3   30-39%
    4   40-49%
    5   50-59%
    6   60-61%
    7   70-71%
    8   80-81%
    9   90-100%

Additional Habitats

In some cases, additional distinct habitats may be present within the 50-m radius circle around the point-count station that do not get adequately characterized in any of the assessments of specific habitat components (e.g. overstory, shrub layer). For example, a

meadow or riparian area may occur within the circle, along with the dominant forest or other habitat, but may contribute little to either the shrub layer, mid story or overstory. Nonetheless, these minor habitats may by significant for the birds present within the 50-m circle. In these situations, list up to three additional habitats in the appropriate space, using the 2-letter habitat codes provided.

Sub-canopy/mid-story

In forest, this category is intended to assess the foliage mass roughly in the middle vertical third, particularly if there is a distinct sub-canopy of a different species mix than that present in the overstory.

Volume – Estimate the foliage mass in the middle vertical third of the forest in 20% increments: 1 = 1-20%, 2 = 21-40%; 3 = 41-60%; 4 = 61-80%; and 5 = 81-100%. Note that it would be quite rare for this category to score greater than 3 and that many (most?) probably score less than 3.

Species – If, and only if, there is a distinct sub-canopy comprised of tree species different from that making up the overstory, enter as many as three species' 2-letter codes in the spaces provided. If there is no distinct sub-canopy, enter "N" in the Species #1 space.

Shrub Layer

This category is intended to estimate the amount and species makeup of any woody shrub (*including* seedling trees) layer present. Generally, shrubs are >0.5 meter high and <5.0 meters high. Anything taller than 5.0 meters should be considered part of the sub-canopy (e.g., very tall oaks or aspens that are of greater height); anything shorter than 0.5 meter should be considered in the ground cover category.

Volume – Estimate the foliage mass of all woody shrub species AND seedling trees present (see definition above) scored on a 10-point scale, for which, see **Overstory** Species compostion.

Mean height – Estimate the average height (to the nearest meter) of the shrub layer within a 50-m radius of the count station.

Species composition - Identify the shrub species (including seedling trees) present and record the *relative* percent of the total shrub layer occupied by each species within a 50-m radius of each point-count station; as many as five species may be listed. Note that if only one shrub species is present, the relative percent should be 100% (9), regardless of how much of the circle is occupied by the species. Shrub species should be recorded on the data forms using the correct 2-letter vegetation code provided in the list. Please use the same 10-point scale as above, for recording relative abundance of each species.

Ground Cover

Ground cover is classified into four categories:

    1) woody vegetation below 0.5 m (roughly knee height),
    2) broad-leaved herbaceous plants (forbs),
    3) grass, and
    4) bare ground and/or leaf litter.

At each point-count station, estimate (to the nearest 10 percent) the total percent of ground cover within the 50-m radius circle around the point-count station that qualifies for each category. Please use the same 10-point scale as presented above, but note that for ground cover, this is an absolute scale, rather than a relative scale.

At each point count that is conducted, please put an "N" in the box for any category that is absent from the 50-m circle, rather than leaving it blank. It will be assumed that blank boxes represent point counts where the ground cover was not assessed, either because the count was not conducted or because you forgot to record it.

Land Bird Monitoring Protocol for the Park Units in the Northern Colorado Plateau Network

Standard Operating Procedure (SOP) # 7

Data Management

Version 1.00 (December 15, 2004)

Revision History Log:

| Prev. Version #	Revision Date	Author	Changes Made	Reason for Change	New Version #

This Standard Operating Procedure (SOP) describes how data collected as part of the Rocky Mountain Bird Observatory - Monitoring Colorado's Birds (MCB) program in Northern Colorado Plateau Network (NCPN) park units are managed. The Rocky Mountain Bird Observatory manages the database and conducts all entry, verification, and validation of data in this protocol. Therefore, primary responsibilities for data management lie with the Rocky Mountain Bird Observatory. However, a copy of all data collected within NCPN park units will be stored and archived with the NCPN Inventory and Monitoring Program. Therefore, this SOP focuses on metadata and archiving procedures, with some background information about database design and data entry.

All data collected in the field are sent to RMBO:

Jason Beason
14500 Lark Bunting Lane
Brighton, CO 80603

I. Database Design and Data Entry

The Rocky Mountain Bird Observatory has designed and maintains a Microsoft Access database for entering and managing data collected during surveys. Data from field forms are entered into a local copy of the database by the person conducting the surveys. After a series of quality control checks, these database records are then uploaded into the central MCB database located at the RMBO offices in Ft. Collins. In December, 2004, the database was undergoing an upgrade and redesign in order to improve functions and normalization. The Rocky Mountain Bird Observatory also is designing an Internet-based application of the database so that data entry can also be completed on-line. Both developments are expected to be completed in 2005.
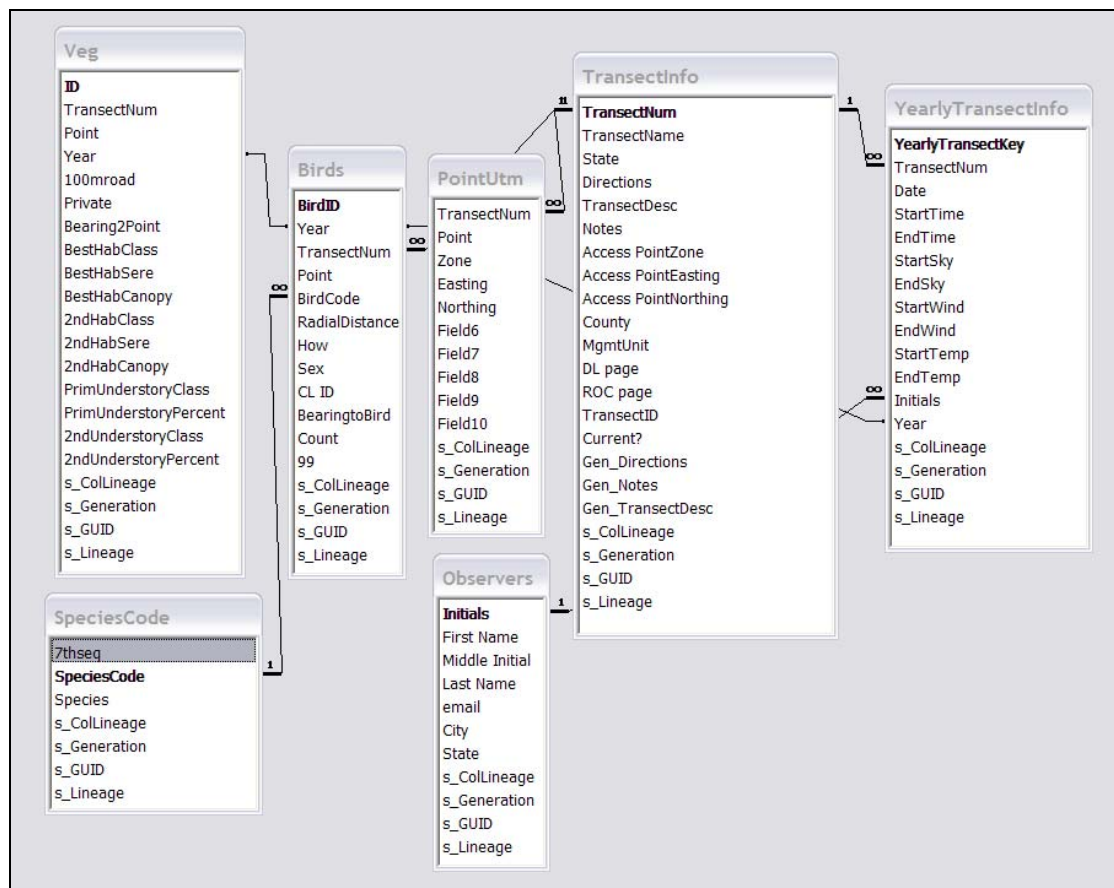

Figure 7-1. Data model for 2004 MCB database maintained by the Rocky Mountain Bird Observatory.

The data model for the MCB database (Fig. 7-1) consists of a primary transect table that is linked to records corresponding to each point on a transect. Data on habitat, birds observed, observers, and observation conditions are stored in separate linked tables.

Data from field forms are entered into a local copy of the database by the person conducting the surveys. After a series of quality control checks performed by the person entering the data, the project manager, and the data manager, these database records are then uploaded into the central MCB database located at the RMBO offices in Ft. Collins.

At the conclusion of a field season, after data have been entered, verified, and validated by RMBO, a subset of the database in Access format will be provided to NCPN. This subset will comprise all records entered to date for survey locations within NCPN park units.

II. Data Archiving

Archived versions of the database are created and stored by RMBO. Original field forms are stored at the RMBO office in Ft. Collins, with a set of copies stored off-site in a different RMBO office.

All annual NCPN park unit data sets that are received from RMBO will be archived by NCPN in their native Access database format. These data sets will be stored on the NCPN server:

> *X:\ Archive\Monitoring_Archive\Land_Birds\Data\Annual_Data\[year]*

File names will consist of the database name, the date it was created, and the word Archive. Example:

> *MCB_10Nov2005_archive.mdb*

In addition to the copy of the database in Access format, all database tables in the annual data sets will be archived in a comma-delimited ASCII format by using the Access_to_ASCII.mdb utility developed by the NCPN. These ASCII files will reside in the same subdirectory as the Access database file.   File names will consist of the table name and the date it was created, and a .txt extension. Example:

> *tbl_transect_10Nov2005.txt*
> *tbl_observer_10Nov2005.txt*

All archived files will be designated as read-only.

III. Metadata Procedures

Documentation of all database tables and fields will be maintained by RMBO, and will be completed and available with the revised version of the database. The NCPN will complete and maintain an I&M Dataset Catalog record for the project and the Access database, and will update the record contents annually.   Any spatial datasets created by the NCPN that are used for data analysis or distribution will have associated FGDC-compliant metadata records completed using ArcCatalog.

The complete protocol for this project (Protocol Narrative and SOP #s 1-9) is an integral component of the project metadata. All narrative and SOP version changes are noted in the Master Version Table (MVT), which is maintained in SOP #9.   Any time narrative or SOP versions change, a new Version Key number (VK#) must be created and recorded in the MVT, along with the date of the change and the versions of the narrative and SOPs in effect. The Version Key number is essential for project information to be properly interpreted and analyzed. *The protocol narrative, SOPs, and data should not be distributed independently of this table*.

Land Bird Monitoring Protocol for the Park Units in the Northern Colorado Plateau Network

Standard Operating Procedure (SOP) # 8

After the Field Season

Version 1.00 (December 15, 2004)

Revision History Log:

Prev. Version #	Revision Date	Author	Changes Made	Reason for Change	New Version #

This Standard Operating Procedure (SOP) provides a brief summary of post-season procedures for landbird monitoring in the Northern Colorado Plateau Network (NCPN) park units. Observers should be familiar with and follow these procedures after the field season is completed.

Procedures:

1. Equipment must be cleaned, repaired, and returned to their proper storage areas in the NCPN park unit or to the Rocky Mountain Bird Observatory. All references manuals, materials, and extra data sheets should be filed or re-shelved in their appropriate storage location. Clean the insides and outsides of all vehicles used in the field.

2. Field data sheets should be organized and checked to be sure that they have been filled out completely. Checking for completeness should generally be done before leaving the field.

3. All data collected in the field are sent to:

    Jason Beason

    Rocky Mountain Bird Observatory:
    14500 Lark Bunting Lane
    Brighton, CO 80603

Land Bird Monitoring Protocol for the Park Units in the Northern Colorado Plateau Network

Standard Operating Procedure (SOP) #9

Revising the Protocol Narrative and SOPs

Version 1.00 (December 15, 2004)

Revision History Log:

Prev. Version #	Revision Date	Author	Changes Made	Reason for Change	New Version #

This Standard Operating Procedure (SOP) explains how to make and track changes to the Land Bird Protocol Narrative and associated SOPs for the park units of the Northern Colorado Plateau Network (NCPN). The Land Bird Monitoring Protocol Narrative and SOPs are based on the Rocky Mountain Bird Observatory (RMBO) - Monitoring Colorado's Birds Protocol. Over time, the protocol narrative and SOPs may require modifications as directed by RMBO. The following procedures must be followed when making changes to ensure that previous data collection and processing procedures are clearly understood when using and interpreting historical data sets. Similarly, clearly articulating new methods is key to credible interpretation of data acquired since the implementation of changes. Personnel making changes must be familiar with this SOP to ensure that proper reviews are conducted, and that documentation standards are followed.

Procedures:

1. Modifications must be reviewed for clarity and technical soundness. Small changes or additions to existing methods will be reviewed in-house by RMBO or NCPN Inventory and Monitoring staff. An outside review will be encouraged by NCPN for whole-scale changes in methods. Regional and national staff of the National Park Service and experts outside of the Park Service with familiarity in bird monitoring and data analysis would be used to review major changes.

2. All changes must be documented, and updated protocol versions must be recorded in the Revision History Log that accompanies the Protocol Narrative and each SOP. Changes are recorded only in the Protocol Narrative or the SOP being modified. Version numbers increase incrementally by hundredths (e.g. version 1.01, version 1.02, etc.) for minor changes. Major revisions will be designated with the next whole number (e.g., version 2.0, 3.0, 4.0 …). Record the previous version number, date of

revision, author of the revision, identify paragraphs and pages where changes are made, and the reason for the changes along with the new version number.

3. Narrative and SOP updates may occur independently. That is, a change in one SOP will not necessarily invoke changes in other SOPs: a narrative update may not require SOP modifications. All narrative and SOP version changes must be noted in the Master Version Table (MVT), which is maintained in this SOP. Any time a narrative or an SOP version change occurs, a new Version Key number (VK#) must be created and recorded in the MVT, along with the date of the change and the versions of the narrative and SOPs in effect. The VK number increments by whole integers (e.g., 1,2,3,4,5). Updates to the MVT also must be provided to the NCPN Data Manager for inclusion in the master version table database. The Version Key number is essential for project information to be properly interpreted and analyzed. *The protocol narrative, SOPs, and data should not be distributed independently of this table.*

4. New versions of the Protocol Narrative and SOPs must be posted on the NCPN web page. Previous versions of the Protocol Narrative and SOPs must be archived in the NCPN Land Bird Protocol Library (X:\Archive\Monitoring_Archive\Landbird\Protocol_Library\).
